

THE ACCESS GAME

CANNOT ERASE THE SOURCE

Child-Reachable Sexual Reward Markets, Commercial Measurement, Rhodes/NoFap, School Receiver Failure, and Category-Control Suppression

Working Evidence Model - Version 1.0

Prepared for Stacey Kahns-Gray

July 12, 2026

Core Strike

The device changes. The source does not. Adult sexual-reward market actors made the machinery child-reachable, converted childhood participation into commercial evidence of demand, and then dispersed the resulting injury into family, school, clinical, disciplinary, and ideological boxes.

Source-Retention Rule

Every downstream event must retain the upstream source: child-reachable adult sexual-reward machinery, commercially measured participation, and the actor chain that benefited from continued access. A school device may prove one access point; it cannot narrow the cause to school devices.

Children = children.

Document Control

Scope Lock

This model is device-neutral and location-neutral. It applies whether access occurred through a school laptop, home computer, personal phone, tablet, gaming console, borrowed device, public network, or later technology. Device ownership is an evidentiary fact, not the originating cause.

Claim-status key

Code	Status	Meaning
R	Record	Primary source, official source, judicial record, or documented public fact.
A	Allegation	A claim pleaded in litigation or made by a party; not yet established as a merits finding.
I	Structural inference	A reasoned connection drawn from the documented allocation of access, data, classification, benefit, and burden.
P	Proposed rule	The governing rule advanced by this model for evidence, policy, or legal development.

Contents

1. Executive findings
2. Source correction and complete causal chain
3. The access game
4. Commercial measurement and consent laundering
5. Alexander Rhodes as a bridge witness
6. The Surgeon General experiment comparator
7. NoFap as a demand-side return-signal receiver
8. Category control and witness disqualification
9. The school role under an any-device model
10. OCR/CRDC child-and-outcome erasure
11. Heterosexual male unequal treatment because of sex
12. The school-district MDL contradiction
13. Intervention capture
14. Integrated cause model
15. Proof matrix and future evidence protocol
16. Sources and status notes

1. Executive Findings

- **The source remains attached.** The originating source is the adult sexual-reward business model that made high-intensity material broadly child-reachable and commercially measurable. [P1][P2]
- **The device is a delivery surface.** School, home, personal, borrowed, and public devices change evidence and control questions; they do not change the source of the product or the actor that benefited from access.
- **Participation is not informed consent.** Searches, viewing time, repetition, category movement, and return behavior generated inside a designed commercial pathway cannot be converted into a child's consent to the developmental endpoint. [P1]
- **Rhodes is a bridge witness.** The public record places Alexander Rhodes inside the first generation raised with effectively unlimited online pornography, beginning with exposure around age 11, followed by later recognition and aggregation through NoFap. [W1]
- **The experiment language converges.** TIME described that generation as feeling like unwitting guinea pigs in an unmonitored experiment in sexual conditioning; the U.S. Surgeon General later described children as unknowing participants in a decades-long social-media experiment. The subjects differ, but the governance structure is comparable. [W1][W2]
- **NoFap is a return-signal population.** Its evidentiary importance is not that every member shares one diagnosis. It aggregates demand-side reports that were otherwise divided into private use, shame, dysfunction, relationship effects, compulsion, or individual failure.
- **Schools are not the original product source.** Schools are compulsory receivers, access controllers in some settings, classifiers, record keepers, and intervention nodes. Their role is to preserve the source when the output reaches school, not replace the source with a device violation or generic bullying label.
- **OCR/CRDC preserves allegations and loses the child.** The 2023-24 architecture separately collects sexual-orientation and religion allegations, but lacks sexual-orientation and religion victim/discipline fields, lacks the cyber medium, and lacks case-level linkage among allegation, victim, and outcome. [P3]
- **The heterosexual male child has a direct sex-discrimination injury.** His male sex and heterosexual participation can be used to presume willingness, resilience, culpability, or reduced injury, making sex operational for blame while unreadable for protection. [P4]
- **The school-district MDL proves institutional capacity.** School districts have pleaded product-design causation, aggregate childhood injury, institutional disruption, and recoverable public cost when schools are plaintiffs. That capacity cannot disappear when a child needs the receiver. [W5][W6]
- **Category control is part of the causal architecture.** Relabeling a return-signal witness as religious, shame-driven, anti-sex, misogynistic, extremist, or anti-scientific changes the receiver and removes the market process from the center of inquiry. [P2][W3]

Controlling Sentence

They made children commercially readable across devices, made the resulting injury institutionally fragmented, and then attacked the people who aggregated the return signal instead of receiving the signal as evidence of the upstream pathway.

2. Source Correction and Complete Causal Chain

The earlier school-device framing was too narrow because it made a school-controlled access point appear to be the origin. The corrected model keeps three roles separate:

Role	Actor/function	What must remain attached
Originating product source	Adult sexual-reward market actors control product reach, search, categories, ranking, recommendation, traffic, and monetization.	The child-reachable product and the commercial benefit from continued participation.
Delivery/access surfaces	Sites, browsers, operating systems, app stores, networks, schools, parents, devices, and age-assurance intermediaries occupy different gate positions.	A gate failure cannot erase the product source or convert access into child fault.
Downstream receivers	Schools, families, doctors, therapists, investigators, courts, recovery groups, and civil-rights systems receive separate outputs.	The receiver must preserve the common source instead of treating each output as a new individual origin.

Complete causal chain

Adult sexual-reward machinery made child-reachable - Free reach, searchable libraries, constant novelty, categories, and rapid delivery.

V

Child participation before adult capacity - Access occurs through any available device or network.

V

Commercial measurement - Search, view, duration, repeat use, tags, categories, and return behavior become data.

V

Consent laundering - Measured participation is translated into preference, demand, and supposed consent.

V

Developmental and behavioral outputs - Distress, compulsive use, changed expectations, peer conduct, humiliation, sexual-function or relationship complaints.

V

Fragmented receivers - School discipline, cyberbullying, Title IX, family supervision, clinical treatment, recovery, or criminal-risk systems.

V

Source suppression - The product source and measurement process fall out of the child record.

V

Witness disqualification - The person who reconnects the chain is reclassified as ideological, religious, shame-based, misogynistic, extremist, or anti-scientific.

No-Substitution Rule

A downstream actor can be responsible for the function it controlled without becoming the original source. Peers can be responsible for photographing and circulating a private event. A school can be responsible for classification and response. Neither replaces the adult market actor that made and measured the sexual-reward pathway.

3. The Access Game

The access game prevents a durable owner by moving the disputed gate while leaving the commercial source intact. [I]

Gate shift	Public story	What remains unchanged
Site-level age gate	The site says verification burdens adult privacy or is technically ineffective.	The operator still controls whether the adult product remains reachable and whether it withdraws from a jurisdiction.
Device or operating-system gate	Responsibility moves from the site to Apple, Google, Microsoft, browsers, app stores, or device manufacturers.	The adult product, search architecture, traffic, and monetization remain market-controlled.
Parent gate	The child reached the product because supervision or home controls failed.	Commercial behavior is still counted as audience and demand.
School/network gate	The child bypassed a filter or violated an acceptable-use rule.	The child becomes discipline-readable while the upstream product remains outside the incident record.
Child gate	The child chose, searched, returned, or circumvented.	Participation produced inside the pathway is treated as original preference and consent.
Inevitability claim	Children will always find a way, so prevention is unrealistic.	Inevitability becomes an exculpation claim for continued broad reach.

The Supreme Court upheld Texas's site-level age-verification requirement in *Free Speech Coalition v. Paxton* in 2025. That ruling does not solve every technical or privacy question, but it defeats the claim that the site-level access node is legally nonexistent. [W4]

The historical record also shows that the access dispute has long been framed around filters, user privacy, and teenagers' ability to evade controls. In the 2016 *TIME* account, Rhodes described having relatively unfiltered Internet access from childhood, and the article documented the broader generation's access to unlimited, fast, private, and novel content. [W1]

Access-Game Strike

The market cannot disclaim responsibility because another actor controlled the device while using behavior produced through that device as commercially valid proof of audience, preference, and demand.

4. Commercial Measurement and Consent Laundering

The core consent error is not that a child clicked a prohibited item. It is that behavior generated inside a commercially designed environment is converted into authorization for the environment and its endpoint. [P1]

Stage	Commercial interpretation	Correct evidentiary meaning
Exposure	Impression or visit	The product was reachable before adult capacity.
Search and click	Interest signal	The child interacted with the offered architecture.
Viewing time	Engagement	Duration was measured inside the actor-controlled environment.
Repetition	Preference	Return behavior can be an output of repetition and reward, not proof of informed authorization.
Category movement	Demand segmentation	The platform can observe and shape how the child moves through a taxonomy.
Escalation/novelty	Higher-value engagement	A commercially usable response mechanism is not naturalized consent.
Later endpoint	Original sexuality or individual fault	The market-created conditions must remain part of causation.

Court-record infrastructure already identified

- **Data harvesting and targeted advertising:** Does 1-9 v. Murphy contains judicially described data-harvesting, data-sale, targeted-ad, tag, category, thumbnail, and engagement evidence. [P5]
- **Platform-created discovery architecture:** Doe #1 v. MG Freesites contains Rule 56 record descriptions of platform-created thumbnails, tags, categories, titles, search, and algorithms used to help users locate content. [P5]
- **Demand-side data fields pleaded:** Jane Doe v. Aylo Holdings alleges extraction of identifiers, viewing histories, tags, tag frequency, search terms, profiling, and advertiser targeting. This is a pleading and a discovery map, not a merits finding. [P5]
- **Recommendation as platform conduct:** Anderson v. TikTok supplies a legal bridge for treating tailored recommendations as the platform's own first-party conduct rather than merely user-supplied content. [P5]

Locked Rule

Market-research participation cannot be used as consent to a developmental endpoint that market actors formed, intensified, measured, and monetized.

5. Alexander Rhodes as a Bridge Witness

Rhodes matters because his public account connects the childhood entry point to later recognition, aggregation, and an organized demand-side return signal. [R]

Node	Public record	Evidentiary function
Childhood entry	TIME reported first exposure around age 11 through a pop-up and Rhodes' description of relatively unfiltered Internet access.	Places the witness inside childhood access before adult capacity.
Repetition	TIME reported Rhodes' account of very frequent adolescent use.	Identifies repeated participation inside the environment; it does not by itself prove every causal mechanism.
Later recognition	Rhodes described relationship and sexual-response consequences and later stopping use.	Connects early participation to a later self-identified endpoint and return signal.
Aggregation	By 2016, TIME reported about 200,000 members across his sites and approximately one million unique monthly users.	Shows that the return signal was not limited to one isolated individual.
Nonreligious framing	Rhodes stated that he did not seek a ban and described the project as recovery-oriented and sex-positive.	Directly contradicts reduction of the witness to a religious prohibition campaign.

Historical Experiment Signal

TIME described the first unlimited-online-porn generation as feeling like "unwitting guinea pigs in a largely unmonitored decade-long experiment in sexual conditioning." [W1]

That sentence is not a judicial finding and does not establish a complete causation case. Its importance is temporal and structural: the return-signal population publicly identified the experiment condition years before a federal public-health advisory used comparable experiment language for a different digital system.

Rhodes Bridge

child exposure -> repeated participation -> later recognition -> aggregation through NoFap -> public challenge to the neutral-market story

6. The Surgeon General Experiment Comparator

The 2023 Surgeon General advisory concerns social media, not pornography. It is used here as an official governance comparator, not as proof that the two products are identical. [R]

Federal Recognition
"Our children have become unknowing participants in a decades-long experiment." [W2]

Governance object	Surgeon General advisory	Application to this model
Population deployment	Near-universal youth participation before sufficient safety evidence.	Adult digital systems can reach children at scale before independent safety knowledge is complete.
Data asymmetry	Technology companies hold data needed to understand effects; lack of access and transparency obstruct research.	Commercial actors can know the audience at higher resolution than public injury systems.
Developmental timing	Childhood and development are occurring now; children cannot wait for complete evidence.	Uncertainty cannot operate only as permission to continue exposure.
Burden allocation	The advisory calls for action by companies, policymakers, researchers, families, and schools.	Children cannot carry the recognition and prevention burden for an adult-deployed system.

Comparator Rule
When an adult digital system is deployed to children before safety is established, later uncertainty does not transform the children into consenting research subjects or make the resulting injury a purely individual problem.

7. NoFap as a Demand-Side Return-Signal Receiver

NoFap's evidentiary significance does not depend on every participant sharing one diagnosis, one motive, or one endpoint. Its significance is that a large population independently attempted to make the demand side readable after the original systems did not provide a child-facing receiver. [I]

Return signal	How it is usually individualized	What aggregation changes
Early exposure	Curiosity, private behavior, family supervision	Reveals a repeated entry condition across people and places.
Unwanted repetition or loss of control	Weak will, shame, moral conflict	Creates a population-level question about reward architecture and access.
Attempts to stop	Personal lifestyle choice	Supplies evidence about persistence, barriers, and recovery trajectories.
Sexual-function or relationship complaints	Private medical or relationship problem	Connects demand-side behavior to later downstream systems.
Distress and identity conflict	Religious guilt or ideology	Requires separation of moral interpretation from the reported behavioral pathway.
Public advocacy	Anti-sex campaign or moral panic	Creates pressure for upstream data, independent research, and ownership.

Receiver Rule
A recovery population is not disqualified as evidence because it formed after the original exposure. The delayed receiver may be the first place where the common pathway becomes aggregable.

The model therefore treats NoFap and related recovery communities as return-signal evidence requiring investigation, data linkage, and source retention - not as automatic proof of a single diagnosis and not as a substitute for independent causal research.

8. Category Control and Witness Disqualification

Category control changes the object of inquiry. Instead of testing the access, measurement, recommendation, and developmental pathway, it converts the witness into the problem. [I]

Original question	Substituted classification	Routing consequence
What happened to children exposed before adult capacity?	Religious anxiety or moral shame	The injury becomes a belief problem rather than a product-and-development question.
Did commercially measured participation reflect informed consent?	Anti-porn ideology or sex negativity	The consent object disappears and speech/attitude becomes central.
Why did a large recovery population form?	Misogyny, extremism, or political identity	The population becomes a threat object rather than a return signal.
What did platforms know from user data?	Anecdote or misinformation	Commercial data remains private while public witness data is downgraded.
Was the witness defamed or institutionally suppressed?	Attack on science or academic freedom	Scientific authority becomes the protected object; source accountability recedes.

Rhodes and NoFap filed a federal action against Aylo entities and named academic, publishing, and other defendants. The complaint alleges coordinated defamation, interference, and manipulation of scientific and public classifications. Those allegations remain contested and pending; the docket establishes the existence and procedural status of the dispute, not the truth of every allegation. [W3][A]

Category-Control Strike

The category attack is not separate from the cause. It is the mechanism by which a demand-side return signal is converted into a defect in the witness, allowing the market process to remain the presumed neutral baseline.

9. The School Role Under an Any-Device Model

The model does not require school-device access. A child can arrive at school carrying outputs generated through any device. The school then becomes a compulsory receiver with specific control over classification, evidence, records, routing, and protection. [P]

School-controlled node	Required source-preserving function	Common source-dropping conversion
Observation or report	Record the reported output and preserve the upstream exposure allegation.	Treat the event as an isolated behavior problem.
Cyberbullying intake	Preserve child, medium, sexualized content, distribution, motive, and outcome together.	Record generic cyberbullying without the child's status or upstream pathway.
Title IX/civil-rights screening	Evaluate sex-based interpretation and unequal treatment without male-normality assumptions.	Treat male participation or arousal as consent, mutuality, or reduced injury.
Device/network record	Use logs as evidence of reachability and institutional knowledge where available.	Use the same logs only to prove student misconduct.
Discipline	Separate the child's rule violation from victim status and peer/institutional wrongdoing.	Make the harmed child more legible as a violator than as a victim.
Aggregation	Connect repeated outputs to common source and design questions.	Split cases among bullying, counseling, discipline, attendance, safety, and criminal-risk systems.

Any-Device Rule

School-issued access strengthens proof of school control when it exists. Its absence does not defeat the cause. The school's receiver duty arises when the output reaches school and the school controls interpretation, preservation, routing, or response.

10. OCR/CRDC Child-and-Outcome Erasure

The 2023-24 CRDC architecture provides a concrete example of a federal system that names some protected bases at the allegation layer but does not preserve the child, medium, and outcome together. [P3][R]

Dimension	What enters	What survives federally
Sexual orientation	An aggregate sexual-orientation allegation; heterosexual is expressly within the definition.	No heterosexual victim field and no sexual-orientation victim or discipline field.
Religion	An aggregate religion allegation and religion-subtype allegations.	No religion victim field and no religion discipline field.
Cyber medium	Qualifying phone, Internet, social-media, SMS, remote-platform, and school-device conduct is reportable.	No retained cyber, platform, device, medium, or location field.
Victim	The student may reappear under a broader sex, race, or disability victim table.	The allegation basis can disappear from the child record.
Discipline	A disciplined student may appear in a broader basis table.	No case-level link proves which allegation produced which response.
Pattern	Aggregate allegations, victims, and discipline can all exist.	The system expressly does not assume they are related and may split them across schools.

Operational Erasure

The federal system can say that an allegation existed. It cannot show whether a heterosexual child or religion-targeted child was protected, whether the event was cyberbullying, whether discipline followed, or whether repeated cases formed a pattern.

This does not prove that no district ever records more locally or that no child ever receives help. It proves that the identified federal reporting architecture cannot preserve the protected basis, child, cyber medium, and outcome as one measurable pathway. [R]

11. Heterosexual Male Unequal Treatment Because of Sex

The protected center is not merely that a male student was involved in a sexualized event. It is that a heterosexual male child can be treated differently because of sex when his male sex and heterosexual participation are used to change the meaning of his injury and his access to protection. [P4]

Fact	Male-specific interpretation imposed	Protection lost
He was exposed before adult capacity.	Ordinary male curiosity or natural male demand.	Recognition of an adult-created developmental pathway.
He participated or became aroused.	Willingness, consent, maturity, or harmlessness.	Protected evaluation without a male-consent presumption.
His private sexual conduct became visible.	He caused the embarrassment by acting improperly.	Separation of private conduct from nonconsensual observation and circulation.
Peers photographed or circulated the event.	Teasing, boys being boys, or a consequence of his behavior.	Victim recognition, evidence preservation, and sex-aware cyberbullying review.
He used a prohibited device or content source.	The incident becomes his device violation.	The school can record his misconduct while preserving his independent victim status.
He reports humiliation or distress.	Male resilience, joking, or reduced injury.	Supportive measures and equal institutional seriousness.
He is heterosexual.	His orientation is treated as ordinary and therefore legally irrelevant.	Equal use of the sexual-orientation and sex-based protection framework.

Application: private event photographed and circulated

A heterosexual male student is photographed during private sexual conduct while viewing adult material, and the image or related information is circulated for humiliation. The correct sequence is:

Upstream exposure - Adult sexual-reward machinery was child-reachable through a device.

V

Private participation - The child's conduct is an output within the pathway, not consent to observation or distribution.

V

Second injury - Peers create a separate wrong by photographing, circulating, and weaponizing the private condition.

V

School classification - The school can preserve both any device violation and the child's independent victim status.

V

Sex-discrimination test - Officials may not use male sex, heterosexuality, arousal, or participation to presume consent, resilience, culpability, or reduced injury.

Direct Injury

His sex is made operational when it increases culpability and made unreadable when it would establish his protected injury.

12. The School-District MDL Contradiction

School districts participating in the social-media adolescent-addiction litigation have asserted that platform design can foreseeably produce youth engagement, mental-health injury, educational disruption, and institutional cost. The litigation concerns social media, not adult sexual-reward products, but it demonstrates institutional capacity to plead and value design causation. [R/A]

Outward school position	Inward child position	Contradiction
Commercial design can shape youth behavior.	Sexual-reward participation is ordinary curiosity or natural male demand.	Design causation is recognized when the school sues and naturalized when the child needs a receiver.
Childhood harm can be aggregated across students.	Each child's exposure, cyberbullying, distress, or compulsion is an isolated case.	Aggregation exists for institutional damages but disappears for the injury population.
Schools incur staff, mental-health, and program costs.	Families and children receive supervision, therapy, discipline, or recovery burdens.	Public cost is upstream-recoverable in one lane and individualized in the other.
Product features and company conduct are proper discovery objects.	The child must prove personal fault, motive, severity, or individual pathology.	The actor chain is discoverable outward and legally unreadable inward.

The official MDL record includes many school-district plaintiffs. In May 2026, the Breathitt County School District bellwether resolved through settlements with the platform defendants; the settlements were not admissions, but the broader school-district litigation continued. [W5][W6]

Aggregation and Receiver Concession

When schools use aggregate childhood injury to establish institutional damages, they concede that childhood harm can be aggregated, causally investigated upstream, and converted into recoverable value. They cannot deny the same aggregation and receiver requirement when the child is the injured claimant.

13. Intervention Capture

Intervention becomes institutionally attractive because it can manage the damaged population without naming the original access pathway or assigning an upstream owner. [P6][I]

Prevention	Intervention	Incentive effect
Blocks child access before injury.	Treats symptoms after exposure.	Continuation remains possible.
Names the adult-controlled hazard.	Names the individual problem.	Causation moves downstream.
Reduces formation of demand and supply populations.	Creates counseling, moderation, discipline, compliance, and recovery services.	Cleanup activity can expand while the market persists.
Creates an owner and duty.	Creates referrals and programs.	Institutions can show visible action without closing the source.
Requires independent evidence and underwriting.	Allows original benefit actors to sponsor safety, research, or education.	The actor chain can occupy both cause and cure.

Actor-Disqualification Rule

An actor chain that created, expanded, measured, monetized, or preserved the childhood pathway cannot become the exclusive trusted authority over the research, safety, prevention, or intervention response to the resulting injury population.

Clean Sentence

Intervention preserves the machine. Prevention names the machine.

14. Integrated Cause Model

ADULT SEXUAL-REWARD MARKET - Controls high-intensity product reach, search, categories, recommendation, traffic, and revenue.

V

ANY-DEVICE CHILD ACCESS - School, home, personal, borrowed, public, or later devices are delivery surfaces.

V

COMMERCIAL MEASUREMENT - Searches, views, duration, repetition, tags, category movement, and return become market data.

V

CONSENT LAUNDERING - Participation becomes preference; preference becomes demand; demand becomes supposed consent.

V

CHILDHOOD OUTPUTS - Compulsion, changed expectations, distress, peer conduct, humiliation, dysfunction, or later recovery.

V

SCHOOL/FAMILY/CLINICAL FRAGMENTATION - Device violation, cyberbullying, Title IX, discipline, counseling, family issue, diagnosis, or criminal-risk concern.

V

MISSING COMMON RECEIVER - No system preserves source, child, commercial measurement, medium, and outcome together.

V

RHODES/NOFAP RETURN SIGNAL - A demand-side population reconnects childhood access to later consequences and attempts to stop.

V

CATEGORY CONTROL - Religion, shame, anti-sex, misogyny, extremism, misinformation, or anti-science labels disqualify the witness.

V

INTERVENTION EXPANSION - More research, moderation, therapy, discipline, compliance, and recovery without source closure.

V

UPSTREAM OWNERSHIP REMAINS UNRESOLVED - The child population remains commercially legible and legally fragmented.

Complete Contradiction

The child population was sufficiently legible to reach, track, segment, optimize, monetize, discipline, study, and convert into school damages - but not sufficiently legible to receive informed-consent protection, a demand-formation injury record, or an upstream owner.

15. Proof Matrix and Future Evidence Protocol

Current proof matrix

Proposition	Current source	Status	Next proof target
Children encountered effectively unlimited online pornography before adult capacity.	TIME 2016; historical exposure research in project files.	R	Population exposure data by age, access route, and time period.
Platforms and adult sites operated data, taxonomy, search, recommendation, and advertising systems.	Court-Record Evidence Starter; cited dockets and opinions.	R/A	Technical documents, contracts, expert reports, internal research, and discovery.
Measured participation was converted into preference and demand.	Market-Research Participation Is Not Consent to the Endpoint.	I/P	Platform analytics definitions, optimization objectives, and audience-segmentation materials.
Rhodes and NoFap formed an early demand-side return signal.	TIME 2016; NoFap public record.	R	Archived membership, traffic, survey, and longitudinal recovery data.
Government later recognized a decades-long child experiment structure in social media.	U.S. Surgeon General 2023 advisory.	R comparator	Cross-system governance analysis; do not collapse products.
Return-signal witnesses were classified through religion, shame, misogyny, extremism, or anti-science frames.	Rhodes litigation allegations; public statements and publications identified in project files.	A/R mixed	Exact statements, dates, speakers, publication records, corrections, and adjudicated findings.
Schools lack a unified child receiver preserving source, status, cyber medium, and outcome.	2023-24 OCR/CRDC proof packet.	R	Local SIS fields, forms, referral rules, device logs, Title IX routing, and retention practices.
Heterosexual male children can be treated differently because of sex.	Title IX Activation Integrity Doctrine; incident applications.	P/I	Comparator records, repeated classification evidence, training, policy, and decision-maker testimony.
Schools can plead design causation and aggregate childhood cost when suing outward.	MDL 3047 official record; school-district cases and 2026 settlement reporting.	R/A	District complaints, expert reports, claimed costs, discovery requests, and settlement terms where public.
Intervention can preserve the source pathway.	Why Intervention Wins; tobacco comparator.	I/P	Funding, partnerships, prevention contracts, research sponsorship, and conflict disclosures.

Protocol for each new PDF

1. Identify the exact actor, control node, and benefit shown by the document.
2. Attach the evidence to the existing causal stage; do not create a replacement origin.
3. Label the proof status: record, allegation, inference, or proposed rule.
4. Preserve device neutrality unless the document specifically proves a device-control fact.
5. Preserve the child and outcome together: age, sex, orientation or religion where relevant, medium, school response, and downstream consequence.
6. Record what the document can prove and what it cannot prove alone.
7. Add the source to the proof matrix and update the final hard lock only when the new evidence changes the model.

Final Hard Lock

They exposed the child, measured the participation, called the measured result preference, denied the child a receiver, waited for the injury to become an adult recovery population, and then attacked the person who aggregated that population. The device cannot erase the source, and the category attack cannot erase the return signal.

Sources and Status Notes

Web sources are dated to the evidence snapshot used in this version. Project documents are working evidentiary papers supplied in this project; they distinguish public records, allegations, structural inferences, and proposed rules within their own text.

Use limits

- This model does not treat the Surgeon General social-media advisory as a pornography finding; it uses the advisory as a governance comparator.
- The Rhodes federal complaint is a pleaded allegation, not a merits judgment establishing coordination or liability.
- The school-district MDL concerns social-media products; its use here is to prove institutional capacity to plead design causation, aggregation, and public cost.
- The CRDC analysis proves the federal reporting architecture identified in the packet; it does not establish that every local district lacks additional records.
- The any-device rule preserves the source while allowing separate responsibility for schools, peers, platforms, vendors, and other actors at the nodes they controlled.

Version Note

This is a living core model. New evidence should be inserted into the proof matrix and causal chain without dropping the adult-market source or narrowing the cause to a single device, school, family, or child.
