

CHILD EXPLOITATION THROUGH UNOWNED CHILD SUPPLY

Condensed School-Side Model

School authorization, child value conversion, category refusal, pathway disownership, and burden transfer

By Stacey Kahns-Gray

July 11, 2026

Scope Separation

This condensed model does not rely on the IRB contradiction. Market research has already been invoked and is addressed in a separate paper. This document is confined to the school-side objects: authorization, child value conversion, institutional ownership, category formation, records, aggregation, abatement, and burden transfer.

Children = children. No institutional ownership = no lawful child pathway.

Contents

- 1. Governing Claim and Scope Lock
- 2. School Duty Attaches at Authorization
- 3. Child Exploitation Floor and Child Value Conversion
- 4. Unowned Supply and Category Refusal
- 5. Outward Notice, Inward Authorization, and Demand-to-Supply Transfer
- 6. Compulsory Authority, Stakeholder Value, and the Choice Inversion
- 7. Child Incapacity, Produced Absence, and Proof Control
- 8. Pathway Disownership and Ownership Requirements
- 9. Final Hard Lock and Authority Notes

Core Strike

The school used public authority to place children into a value-producing pathway, preserved the institutional and stakeholder value, refused to name the child as supply, and then transferred the resulting burden to the child and family.

Control Chain

Control object	Meaning
Floor	Child exploitation
Mechanism	Unowned child supply
School-side act	School-authorized child value conversion
Institutional event	Pathway disownership
Turn	Child and family burden transfer
Result	No institutional ownership = no lawful child pathway

1. Governing Claim and Scope Lock

This model begins with a narrow school-side claim: a public school cannot use compulsory educational authority to authorize minors into a known-risk, value-producing pathway; preserve the resulting institutional or stakeholder value; refuse to name, own, safeguard, record, monitor, aggregate, or abate that pathway; and then assign the consequence to the child or family.

The model does not require the school to have created the broader attention or sexual market. It requires the school to own the functions it controlled. Authorization is the school-side act. Child value conversion is the operative use. Pathway disownership is the institutional event.

1.1 What the claim covers

The pathway becomes relevant when school authority authorizes, credits, grades, promotes, supervises, requires, pressures, legitimizes, funds, or stakeholder-shapes a child's participation in producing value through:

- image, likeness, identity, visibility, or public-facing presence;
- attention, engagement, reputation, branding, or institutional communications;
- student voice, portfolio development, marketing, leadership, or program promotion;
- online presence, public-facing participation, or market-facing self-presentation;
- data, performance, or stakeholder-facing proof of program value.

1.2 What the claim does not cover

This claim does not challenge ordinary instruction, ordinary technology use, general media literacy, civic participation, ordinary student speech, or educational technology as such. The proof object is the school-authorized conversion of child identity, attention, visibility, reputation, image, data, performance, or public-facing participation into value after the school has notice of the pathway's risks.

1.3 Separation from the market-research paper

The consent and commercial-measurement question is reserved to the separate market-research analysis. This model does not repeat IRB logic or ask whether the pathway should have been treated as research. It asks a different question: who owned the child-facing pathway once a school authorized and benefited from child value production inside it?

Governing Rule

The school does not have to create the market to own its own act of authorization.

2. School Duty Attaches at Authorization

The duty point precedes individualized harm. The child enters through compulsory educational authority, not as an independent adult creator, ordinary market participant, or freely situated commercial actor. School placement changes the child's decision environment and supplies institutional legitimacy to the pathway.

2.1 The school-controlled conditions

The school may control or materially shape:

- access, program placement, course credit, grading, and staff supervision;
- student conduct expectations, refusal conditions, and alternatives;
- stakeholder entry, vendor access, pathway framing, and institutional promotion;
- media releases, communications use, records, reporting channels, and classification;
- safety planning, aggregation, continuation, limitation, correction, and abatement.

Where the institution controls those functions, it cannot preserve the benefit of school authority at entry and disown the pathway when the consequence returns.

2.2 Duty-triggering sequence

Sequence

minor status -> compulsory school authority -> school-controlled authorization -> child value conversion -> institutional or stakeholder benefit -> missing ownership and safeguards -> consequence individualized to child or family

2.3 Authority anchors preserved from the source model

Authority object	Function in this model
Compulsory education	The child participates inside a legally structured educational environment, not an ordinary adult market relationship.
School supervision and control	California Education Code section 44807 is used as an authority anchor for school control over pupil conduct in school-controlled conditions.
Public-entity mandatory duty	California Government Code section 815.6 is used to identify a duty-attachment route where an enactment imposes a protective mandatory duty and the covered injury is proximately caused by nonperformance.
Child-protection history	Child labor, performer, earnings, image/likeness, data, commercial-access, and related protections show that adult-controlled child value production is not treated as automatically neutral.

These anchors do not convert the model into a filed legal claim. They identify the timing and control questions that counsel or a reviewing agency would test against the governing jurisdiction and facts.

Duty Lock

Duty does not wait for individualized harm to return. It attaches when the school authorizes minors into a known-risk value-producing pathway while withholding ownership, safeguards, records, monitoring, aggregation, and abatement.

3. Child Exploitation Floor and Child Value Conversion

Child exploitation does not disappear because the value-producing material is visibility rather than factory labor. The form of value can change while the child-protection principle remains constant.

3.1 The child's role conversion

The relevant conversion is from child participant to value-producing supply. The child may enter as a student, audience member, learner, user, or speaker and be converted into:

- a visibility producer or brand carrier;
- an engagement generator or reputation asset;
- a public-facing identity or advertising surface;
- communications material or portfolio object;
- stakeholder-facing proof of institutional, program, or pathway value.

The role does not become noncommercial or non-exploitative merely because the institution uses educational language. The control question is whether adult authority converted the child into a source of value without the protective ownership that should attach to that conversion.

3.2 Child exploitation floor

The model does not turn on whether the institution paid the child or generated direct revenue from a specific act. Institutional value can be instructional, reputational, stakeholder-facing, communications-based, political, programmatic, or economic. The protected object is the child’s role inside an adult-controlled value system.

Floor

When adult systems convert children into value-producing participants, the child’s role must be named and the adult-side duties must attach. The school cannot use educational framing to keep the value while removing the protection.

3.3 Institutional ownership is the control test

Ownership is not a public-relations statement. It is the operational ability and duty to name the pathway, identify the child's role, create limits, preserve records, receive reports, connect incidents, restrict adult access, monitor risk, correct the pathway, and stop it when necessary.

If the school controlled access, authority, legitimacy, placement, credit, records, reporting, classification, stakeholder participation, or continuation, it cannot route ownership exclusively to platforms, peers, police, families, or the child after the pathway has produced a consequence.

School retained	Institution later says	Ownership problem
Authority and legitimacy	Student choice	The child carries adult autonomy at consequence.
Access and supervision	Platform issue	The school disowns its own authorization function.
Program and stakeholder value	Ordinary opportunity	Value is preserved while child-protection duties disappear.
Records and classification	No pattern	The institution uses the absence it controlled.
Continuation and abatement	Family problem	The least powerful party receives the whole burden.

4. Unowned Supply and Category Refusal

4.1 Definition

Unowned supply means that the child produces value, the adult system hides the child’s value role under acceptable language, the value is preserved, and institutional ownership does not attach. The burden remains available for transfer because no adult actor has accepted the full pathway.

Unowned Supply Rule

The child produces value. The adult system preserves the value. The child’s supply role remains unnamed. Ownership does not attach. The burden returns to the child and family.

4.2 The child-influencer comparator

The child-influencer branch shows that naming is possible. Child visibility was long described through family content, sharenting, parental choice, ordinary posting, and private family expression. Once the child’s value role became unavoidable, law and policy began to recognize labor, earnings, recordkeeping, trust, image/likeness, and adult-side responsibility.

The comparator does not establish that every school pathway is identical to monetized family content. It establishes a narrower point: a child’s role as value-producing supply can be named, and naming changes the protective architecture.

4.3 Category non-transfer into K-12

The same naming move has not been consistently transferred into school-controlled pathways. K-12 can authorize child value conversion under opportunity language while avoiding the ownership duties that would become visible if the child’s supply role were named.

Cover language	Actual function	Protective structure avoided
Student voice	Public-facing identity and institutional communications value	Role definition, limits, records, ownership
Career readiness	Market-facing self-presentation and portfolio value	Refusal alternatives, risk translation, abatement
Leadership / school pride	Brand and reputation carriage	Stakeholder limits and child-protection ownership
Digital literacy / innovation	Visibility, engagement, and data production	Pathway-specific safeguards and aggregation
Community engagement	Stakeholder-facing proof of program value	Adult-side accountability for access and use

4.4 Category refusal is an operating mechanism

Once the category is missing upstream, the school does not need to invent a new escape route in every case. The child’s role can remain divided among opportunity, discipline, safety, online conduct, peer conflict, reputation, digital footprint, family issue, and platform issue. Each substitute category receives a fragment while no category owns the pathway.

The missing category is therefore not a harmless vocabulary gap. It determines whether records stabilize, incidents aggregate, safeguards become mandatory, abatement activates, and the institution must admit that the child was made supply.

Category Lock

The child-influencer branch proves that the naming move is possible. The K-12 branch shows what happens when the same child-supply category is withheld where public authority controls the pathway.

5. Outward Notice, Inward Authorization, and Demand-to-Supply Transfer

5.1 The outward notice mirror

When schools sue or publicly challenge child-facing platform systems, they commonly describe children as vulnerable users, consumers, audience members, advertising targets, attention targets, or engagement targets. That position names the pathway as capable of producing foreseeable child harm.

The mirror arises when the institution authorizes comparable attention, visibility, engagement, branding, or public-facing functions inward under school authority and then treats the child as autonomous because the child is now producing value rather than receiving the design as a user.

Mirror Rule

Naming a child-facing pathway as harmful when the child is a demand-side target creates notice. Authorizing the same pathway function when the child becomes a supply-side value source creates responsibility.

5.2 Demand becomes supply

The pathway changes the child's position without changing the child's developmental status. The child moves from audience, user, consumer, or target into visibility producer, brand carrier, engagement generator, public-facing identity, or stakeholder-facing proof. The institution may suppress vulnerability precisely when the child's participation becomes useful to the institution.

A school cannot use child vulnerability to establish an outward claim and adult-style autonomy to defend an inward authorization. The child did not become less of a child because the institution changed the child's role.

5.3 Reward and pressure as the supply engine

School-authorized pathways can attach immediate rewards to child visibility and public-facing participation: grades, credit, teacher approval, peer normalization, recognition, recommendations, leadership status, access to programs, and future-opportunity framing. Those rewards operate inside a compulsory environment and can make refusal costly or socially legible as failure.

The presence of reward does not prove free adult choice. It proves that the institution structured the decision environment. When the same reward loop produces value for adults, the reward architecture is evidence of pathway control, not evidence that the child independently created the pathway.

5.4 Stakeholder value capture

Vendors, employers, nonprofits, foundations, communications teams, workforce partners, media partners, consultants, and other stakeholders may shape, legitimize, deliver, expand, or benefit from the pathway. Their participation increases the need for school-side ownership because the school supplies the child access, institutional legitimacy, and the conditions under which outside value is produced.

The presence of multiple actors does not erase the function each controlled. The school remains responsible for authorization, access, classification, records, and interruption where those functions remained school-controlled.

6. Compulsory Authority, Stakeholder Value, and the Choice Inversion

6.1 The compulsory pressure stack

A child placed into a school-authorized pathway encounters more than a neutral invitation. The surrounding structure may include adult approval, peer normalization, grades, credit, program access, recommendations, future-readiness claims, school prestige, public recognition, and implied safety. The child is choosing inside conditions adults designed and control.

The pathway becomes more difficult to resist when the institution treats concern as fear, backwardness, overreaction, poor digital competence, lack of ambition, or failure to support opportunity. Protective hesitation can be delegitimized before the child or family has a usable record or category.

6.2 The institutional switch

The Turn

At entry, the child is treated as a student: dependent, supervised, educable, and legitimately directed by the institution. At consequence, the same child is treated as an autonomous actor who chose the exposure, the visibility, the reputational burden, and the future effects.

That switch allows the school to receive the benefit of educational authority while transferring the cost of adult autonomy to the child. It is not cured by a general release, a broad media form, participation language, or the fact that the child complied with an authorized activity. Those objects may document an entry act; they do not by themselves establish ownership of the resulting pathway.

6.3 Protective instinct is a warning signal

Where a child, parent, guardian, or protective adult responds with hesitation, discomfort, refusal, or concern, the institution receives a warning signal. The proper response is to examine the pathway, value flow, pressure,

alternatives, and safeguards. Treating protective resistance as the problem clears the pathway while helping produce the later absence of records and objections.

The child or family is not required to possess institutional vocabulary before the institution must recognize a warning. The adult system controls the translation from raw concern into a recordable, reviewable, and abatable category.

6.4 Burden transfer

Unowned supply always needs a burden carrier. If no adult actor owns the complete pathway, the consequence is distributed into child choice, family supervision, peer conduct, reputation, digital footprint, platform use, counseling, discipline, or police referral. The pathway disappears while the child and family carry its outputs.

Burden-Transfer Lock

The institution cannot use public authority to structure the pathway, centralize the value, fragment the record, and then assign the whole reconstruction burden to the child or family.

7. Child Incapacity, Produced Absence, and Proof Control

7.1 What the child cannot force

The child cannot create the institutional architecture that should have existed before participation. The child cannot independently compel:

- a named child-supply category;
- a stable incident code or institutional record;
- cross-event aggregation and pattern recognition;
- a pathway-specific research or safety category;
- limits on stakeholder access or communications use;
- program correction, suspension, or abatement;
- an institutional admission that harm returned through a pathway the school authorized.

A child cannot report, classify, aggregate, regulate, or abate their own way out of an institutionally unnamed pathway. That is why the burden of category formation cannot be assigned to the child.

7.2 Produced absence

No named category produces predictable absences: no ownership, no stable records, no aggregation, no safety model, no pathway-specific warning structure, no institutional ownership trail, and no abatement trigger. Those absences are then used to deny the pathway.

Where the institution controlled naming, routing, classification, records, reporting channels, aggregation, stakeholder access, continuation, and abatement, the absence cannot be treated as naturally occurring. It may be evidence of the failure itself.

Institutional act	Produced absence	Later defense
Routes events into peer conflict, discipline, or online conduct	No common pathway code	No pattern exists
Keeps child supply unnamed	No ownership trail	No duty attached
Treats each consequence as private	No aggregate record	Cases are isolated
Uses general releases and opportunity language	No pathway-specific warning	Participation was voluntary
Refuses pathway-level review	No abatement record	Nothing required correction

7.3 Selective naming

Produced absence is especially significant where the institution has already named the pathway outward. If the category appears when naming supports institutional recovery and disappears when naming would create inward ownership, the record is not neutral absence. It is category severance.

7.4 Proof-control questions

- What child role was named before authorization: student participant, value-producing supply, or both?
- What institutional or stakeholder value was expected from the child's participation?
- Who controlled access, pressure, alternatives, grading, credit, communications use, records, and continuation?
- What pathway-specific warning, limitation, reporting, aggregation, and abatement structure existed?
- What substitute categories received the outputs, and what common pathway disappeared when those categories were used?
- Who controlled whether the child-supply category, records, aggregate data, and ownership trail were allowed to exist?
- When harm returned, who had authority to acknowledge that it returned through a school-authorized pathway?

Proof Rule

The question is not only what records exist. The question is who controlled whether the category, records, aggregation, safeguards, and ownership structure were allowed to exist.

8. Pathway Disownership and Ownership Requirements

8.1 The event

The violation is not limited to the moment an individualized injury becomes visible. The child-exploitation structure exists earlier, when the school authorizes children into a known-risk value-producing pathway without naming, owning, safeguarding, recording, limiting, monitoring, aggregating, or abating it.

Harm return reveals the abandonment. It does not create the structure. The child becomes exploitable when adult authority converts the child into value-producing supply and refuses pathway ownership.

8.2 Full sequence

Pathway Sequence

child-facing pathway known as a source of harm -> school authorizes the function inward as opportunity -> child value conversion occurs under school authority -> institutional or stakeholder value is retained -> child-supply category does not stabilize -> safeguards, records, aggregation, and abatement fail to attach -> consequence is divided into downstream boxes -> burden returns to child and family

8.3 What ownership requires

Institutional ownership must be operational, not ceremonial. At minimum, it requires the school to:

- name the pathway and the child's value-producing role;
- identify who receives instructional, reputational, stakeholder, communications, or economic value;
- state limits on visibility, image, identity, data, public-facing participation, and stakeholder use;
- provide real refusal alternatives without penalty, loss of credit, or diminished opportunity;
- preserve pathway-specific records and connect related incidents across programs and time;
- create a child-facing reporting and review route that does not depend on adult legal vocabulary;
- monitor foreseeable risks and evaluate whether the pathway should continue;
- aggregate return signals instead of isolating each consequence;
- correct, restrict, suspend, or abate the pathway when the evidence requires it;
- retain ownership when harm returns rather than transferring the entire burden downstream.

8.4 No substitute ownership

A platform complaint, police referral, counseling service, disciplinary process, media-release form, digital-citizenship lesson, or family supervision instruction cannot substitute for pathway ownership. Each may address a separate object. None answers who owned the school-authorized conversion of the child into value-producing supply.

Ownership Lock
A school cannot authorize child value conversion and then refuse to own the pathway that made the conversion possible.

9. Final Hard Lock and Authority Notes

9.1 Final chain

Object	Final meaning
Child exploitation	The governing floor.
Unowned child supply	The mechanism that preserves value while withholding ownership.
School-authorized child value conversion	The school-side act.
Pathway disownership	The institutional event.
Child/family burden transfer	The turn that reveals who was made to carry the unowned pathway.
No institutional ownership	No lawful child pathway.

9.2 Final hard lock

A school cannot authorize children into value-producing visibility, branding, engagement, public-facing identity, student voice, online presence, marketing, portfolio development, communications value, stakeholder-facing proof, or market-facing self-presentation; refuse to name the child as supply; refuse to own the pathway; and then place the cost back on the child or family.

Final Seal
Child exploitation is the floor.
Unowned supply is the mechanism.
School-authorized child value conversion is the act.
Pathway disownership is the event.
Child and family burden transfer is the turn.
No institutional ownership = no lawful child pathway.

9.3 Status and use note

This document is a condensed analytical model, not a filed pleading, adjudicated factual finding, or substitute for jurisdiction-specific legal advice. It preserves the source model's school-side theory while removing the IRB contradiction and reserving the market-research and consent question to the separate paper.

Authority references are issue-spotting anchors carried forward from the source model. Their application depends on the facts, the defendant, the jurisdiction, the asserted injury, available immunities and defenses, and the procedural vehicle selected by counsel. This revision condenses the 62-page May 28, 2026 source, removes the IRB section, reduces repeated lock/harder/final-seal passages, and preserves the core liability architecture.
