

CORRECTION AND CONTAINMENT ARCHITECTURE

Rebuild-or-Remove Model

By Stacey Kahns-Gray

Original date: 04/25/2026 | Revised: 07/12/2026

Core Strike

The existing business model has no entitlement to continuity. It must be rebuilt so that its operating method no longer produces the injury stream, or it must be removed.

If child non-access, truthful disclosure, independent oversight, enforceable exit, worker protection, demand-side interruption, full underwriting, and actor-chain disqualification make the model unprofitable, that is evidence that prior profitability depended on externalized injury.

CORE POSITION

Rebuild-or-Remove Rule

This is not a compliance-retrofit or market-preservation model. It is a business-model fitness test.

The existing adult sexual reward-loop business model may continue only if it is structurally rebuilt so that child non-access, prevention before exposure, classification integrity, independent oversight, labor protections, truthful lifecycle disclosure, enforceable exit, demand-side interruption, full harm underwriting, and actor-chain disqualification are conditions of operation rather than optional safeguards.

Where the model cannot operate without converting child vulnerability into future demand, converting adult vulnerability into durable supply, conditioning demand toward harmful endpoints, obscuring transaction and labor structure, externalizing injury, or controlling the intervention market, the operating model must be prohibited, withdrawn, dissolved, or replaced.

This architecture therefore recognizes two lawful dispositions: complete structural reconstruction under independently enforceable duties, or removal of the business model and disqualification of the actors who preserved it.

The burden is not on injured people to prove that the market deserves abolition. The burden is on the market to prove that it can operate without the operating method that created the injury population.

No-Safe-Harbor Lock

No measure in this architecture constitutes a safe harbor, cure, or authorization for the existing operating model. Disclosure, cooling-off periods, self-exclusion, moderation, exit assistance, labor protections, reporting, age-gate compliance, and intervention services cannot legalize an operating method that continues to depend on child reachability, vulnerability conversion, conditioned demand, durable identity exposure, transaction ambiguity, or injury externalization.

GOVERNING REMEDY CLASSIFICATION

Three Separate Remedy Objects

A. Non-Negotiable Prohibitions. Child access to adult sexual reward machinery; youth-coded demand formation; violence-conditioning architecture; use of participation as consent to conditioning; profit from content persistence after withdrawal; and original profit-actor control of prevention, research, or intervention.

B. Conditions for Any Replacement Adult Model. Labor classification; earnings and lifecycle disclosure; identity separation; cooling-off; transaction clarity; demand-side interruption; enforceable exit and self-exclusion; independent oversight; and full underwriting.

C. Legacy-Harm Obligations. Record preservation; independent investigation; suppression and de-indexing; compensation; treatment and transition costs; public-system reimbursement; re-upload control; and continuing payment for injury already produced.

These categories must not be collapsed. Prohibitions define what cannot continue. Replacement-model conditions govern any lawful successor. Legacy-harm duties survive even if the operating model is withdrawn or dissolved.

I. PRE-ENTRY CORRECTION

Upstream Institutional Duties

A. Pre-Puberty Instruction

Action

Require pre-exposure biological literacy instruction covering:

- reward loops
- limbic vs. prefrontal mismatch

- validation as signal vs. value
- reward-now / cost-later dynamics
- sexualized or sex-based conduct as a signal requiring adult evaluation, not self-classification by the child
- peer labeling and reputational formation
- market systems that convert vulnerability into participation

Effect

Converts instinct into decision-usable understanding.

Reduces entry under misinterpreted signals.

Establishes internal classification awareness before external labeling occurs.

Rationale

Known developmental mismatch exists, but institutions do not consistently translate that knowledge into safeguards.

Instruction is sex-aware in outcome but not restrictive in application. The goal is risk translation, not behavioral limitation.

Child-Burden-Transfer Lock

Instruction is not the primary prevention mechanism and does not transfer non-access, design, supervision, classification, or interruption duties to children.

A child's failure to understand, remember, resist, report, or apply the instruction cannot reduce adult, corporate, school, or institutional responsibility.

II. CLASSIFICATION CONTAINMENT

Foundational Institutional Control

Action

Require institutional frameworks to:

- require preservation and protected evaluation when reported or observed sex-based or sexualized conduct reasonably indicates coercion, exploitation, boundary injury, unequal treatment, reputational harm, or developmental risk
- treat activation as preservation and evaluation, not as a predetermined finding of responsibility
- establish staff-level intake standards for early-stage signals
- require classification at first observation, not first report
- prevent routing into non-harm categories such as “teasing,” “play,” “peer behavior,” or “drama”
- preserve early records before escalation becomes visible
- aggregate repeated signals across students, settings, platforms, devices, and school-linked activities

Effect

Preserves record formation.

Enables aggregation and pattern visibility.

Establishes early institutional knowledge.

Prevents classification blockade.

Rationale

Where classification is not controlled at the signal stage, harm remains legally and institutionally invisible despite continuous occurrence.

The institution cannot claim ignorance after it failed to classify the signal that created knowledge.

III. CLASSIFICATION ACKNOWLEDGMENT

Condition for Use of Corrective Measures

Condition for Use

Use of corrective measures at the classification stage requires formal acknowledgment that prior conduct may have been misclassified at intake.

Required Institutional Position

The institution must confirm that:

- early-stage conduct may have been routed into non-harm categories
- sex-based interpretation may not have been applied at first observation
- classification standards at intake did not consistently reflect Title IX or sex-based harm requirements
- prior non-classification may have prevented record formation and pattern visibility

Action Requirement

Before implementing forward-looking corrections, the institution must:

- issue written clarification of classification standards at intake
- confirm that classification occurs at first observation, not first report
- apply corrected classification standards to current and ongoing cases
- preserve records of prior routing failures where available

Functional Effect

Prevents prospective-only compliance without retrospective acknowledgment.

Aligns corrective action with the actual mechanism failure.

Preserves integrity of record formation going forward.

IV. MARKET ENTRY CONDITION CORRECTION

Platform and Sexual-Market Duties

Mandatory Outcome Disclosure

Action

Require disclosure of:

- median earnings
- earnings distribution
- attrition rates
- lifecycle duration
- reputational persistence
- content persistence
- identity-linkage risk
- escalation pressure over time
- visibility requirements to maintain income
- downstream effects on future work, relationships, housing, education, and safety

Effect

Converts unknown risk into decision-usable information.

Enables probability-based evaluation before exposure.

Prevents aspiration-driven entry from substituting for informed participation.

Rationale

Absence of supply-side outcome data prevents informed consent.

A market that tracks engagement, ranking, pricing, traffic, conversion, and retention cannot claim it lacks enough information to disclose lifecycle risk.

Cooling-Off / Activation Delay

Action

Introduce a mandatory 24–72 hour delay before any public, monetized, searchable, or externally promoted exposure.

Before activation, require exposure to:

- lifecycle outcome data
- risk models
- reward-loop concepts
- reputational persistence warnings
- escalation-pressure disclosures
- identity separation options
- exit and suppression rights

Effect

Disrupts reward-loop-driven entry.

Restores an evaluation window.

Separates decision from immediate validation, attention, money, or ranking reward.

Rationale

Reward dominance occurs before risk evaluation.

The market should not be allowed to convert temporary vulnerability into durable exposure before the participant has decision-usable information.

V. DEMAND-SIDE CONDITIONING CORRECTION

Reward-Loop Training Is Not Nature

Action

Require sexual reward-loop platforms and adult-market actors to identify, report, and prevent design systems that condition demand toward:

- youth-coded categories
- degradation
- disposability
- violence tolerance
- boundary collapse
- escalation dependency
- novelty compulsion
- search normalization of harmful endpoints
- sexual arousal paired with humiliation, coercion, or injury-coded material

Effect

Stops the market from treating conditioned demand as natural baseline.

Prevents the actor chain from using downstream participation as evidence that the endpoint was freely chosen, inevitable, consensual, or legitimate.

Creates a duty to interrupt escalation before the market converts it into a monetized category.

Rationale

The adult sexual reward-loop actor chain cannot use demand formed inside its own reward-loop architecture as evidence of prior, natural, stable, or legitimate demand.

It built searchable, repeatable, measurable, ranked, recommended, and monetized pathways that trained demand over time.

The conditioned endpoint cannot be used as proof of original consent.

VI. SYSTEM STRUCTURE CORRECTION

Labor, Role, and Transaction Clarity

Comparative Model Alignment

Action

Introduce structural elements that exist in legitimate performance and labor systems:

- labor clarity
- role vs. identity separation
- defined compensation pathways
- contractual expectations
- hazard notices
- dispute mechanisms
- exit rights
- identity-protection rules
- occupational-risk accounting
- retirement structure

Effect

Moves the system from aspiration-driven entry to structure-driven participation.

Reduces identity collapse and classification instability.

Prevents the market from selling participation as empowerment while refusing the protections that legitimate labor would require.

Rationale

Aspiration without structure produces distorted entry conditions.

A legitimate job protects the worker from customer demand. It does not require the worker to absorb the risk stream created by the market.

Intent-Based Transaction Disclosure

Action

Where an adult actor seeks sexual access, sexual performance, personalized sexual attention, or sexualized content in exchange for money or another thing of value, the transaction must be expressly identified as commercial before consent, performance, payment, or identity exposure occurs.

Effect

Restores transaction recognition at entry.

Reduces reliance on ambiguity as a structural requirement.

Allows performance to exist as performance rather than required misrepresentation.

Rationale

The benefiting actor may not rely on relational ambiguity, simulated intimacy, undisclosed third-party messaging, or creator-economy language to conceal the commercial character of the exchange.

A market cannot benefit from sexual-use intent while hiding the transaction structure from the person bearing the reputational, bodily, financial, and social cost.

VII. HAZARD CLASSIFICATION FRAMEWORK

During and After Participation

Action

Define, classify, and communicate:

- reputational persistence risk
- classification lock-in
- asymmetrical social cost
- coercion exposure
- violence-conditioning exposure
- identity collapse
- future employment risk
- relationship and family impact
- stalking, harassment, and doxxing risk
- market-created demand pressure
- difficulty exiting once exposure becomes searchable

Effect

Reframes participation as risk-managed activity.

Enables non-moral intervention.

Makes foreseeable harms visible before they are externalized.

Rationale

The risks are known, but they are not structured into usable frameworks.

A market cannot keep the upside measurable and the injury stream invisible.

VIII. REPUTATIONAL MITIGATION AND EXIT RIGHTS

Action

Establish enforceable mechanisms for:

- identity separation
- content suppression over time
- search de-indexing pathways
- transition support
- income-transition support
- legal support for harassment or misuse
- suppression of re-uploaded or scraped material
- prohibition on re-targeting exited participants
- penalties for platforms that profit from persistence after withdrawal

Effect

Reduces irreversibility.

Improves exit viability.

Limits the market's ability to turn temporary participation into permanent classification.

Rationale

Reputational persistence creates structural lock-in.

Exit is not meaningful if the market keeps the identity, content, category, ranking, and social cost alive after participation ends.

Legacy-Harm Duties

Withdrawal or reconstruction of the operating model does not extinguish duties arising from injury already produced.

Required obligations include:

- preservation of internal research, access, ranking, recommendation, moderation, transaction, complaint, and injury records
- independent investigation with no control by original profit actors
- compensation and claims-receiving mechanisms for demand-side and supply-side injury
- payment of treatment, recovery, identity-restoration, transition, and legal-support costs
- reimbursement of school, family, enforcement, and public-health costs transferred downstream
- suppression, de-indexing, re-upload control, and continuing enforcement after withdrawal
- continuing reserves or payments sufficient to address delayed and later-aggregated injury

Legacy-harm duties attach to the injury stream already created. They are not consideration paid for permission to continue the same operating method.

IX. SELF-EXCLUSION AND PARTICIPATION CONTROL

Action

Implement voluntary, enforceable participation limits:

- time-bound self-exclusion
- permanent self-exclusion
- cross-account enforcement
- payment-method enforcement
- mandatory cooldown periods before reactivation
- restriction from platform marketing during exclusion
- restriction from re-targeting, reminders, ranking prompts, or comeback incentives
- reactivation only after renewed outcome disclosure

Effect

Introduces interruption during active reinforcement conditions.

Disrupts escalation and continuous re-entry behavior.

Creates pre-commitment across non-reward and reward states.

Rationale

Participation is sustained through reinforcement loops and temporal distortion.

There is currently no structured interruption mechanism despite known behavioral dynamics.

X. KNOWLEDGE AND ACCOUNTABILITY CORRECTION

Action

Require standardized reporting on:

- lifecycle outcomes
- earnings distribution
- attrition
- exit conditions
- reputational impact
- mental and physical harm reports
- escalation pressure
- coercion exposure
- demand-side conditioning indicators
- violence-coded and youth-coded category growth
- downstream public-cost transfer

- intervention-market dependence

Effect

Closes the demand vs. supply knowledge gap.

Prevents the market from optimizing demand while keeping supply outcomes undisclosed.

Allows regulators, courts, schools, researchers, and the public to see the full risk stream.

Rationale

Demand is optimized while outcomes remain undisclosed.

That is not consent. It is information asymmetry.

XI. FULL HARM UNDERWRITING

Action

Require the adult sexual reward-loop actor chain to price, reserve for, insure, and pay for foreseeable harms created by the model, including:

- prevention
- age non-access systems
- classification systems
- exposure interruption
- exit support
- reputational mitigation
- therapy and recovery costs
- moderation costs
- enforcement costs
- school and family system impacts
- public-health impacts
- demand-side injury
- supply-side injury
- harms from youth-coded and violence-conditioned escalation

Effect

Prevents the market from privatizing profit while externalizing injury.

Tests whether the model can survive without subsidy from harmed populations and public systems.

Rationale

If the model cannot survive full underwriting of the injury stream it creates, then it was not a legitimate market.

It was surviving by forcing others to carry the cost.

XII. ACTOR-CHAIN DISQUALIFICATION

Rule

The original profit actor cannot become the trusted prevention or intervention authority for the harm its own business model created, preserved, and monetized.

Effect

Prevents intervention capture.

Stops the market from using cleanup tools as legitimacy proof.

Separates prevention from preservation.

Rationale

A market that creates the injury population does not get to become the intervention authority for that injury population.

Exit tools do not cure the operating method if vulnerability conversion remains intact.

XIII. SYSTEM EFFECT

When implemented together:

- entry becomes informed, not reactive
- exposure becomes prevented, not cleaned up after capture
- participation becomes structured, not ambiguous
- risk becomes visible, not delayed
- demand conditioning becomes named, not naturalized
- supply pressure becomes measurable, not individualized
- classification becomes controlled, not emergent
- exit becomes enforceable, not symbolic
- harm becomes underwritten, not externalized
- intervention no longer preserves the market that created the injury
- the existing business model loses any presumption that continuity is the preferred outcome
- the enterprise survives only if it becomes a structurally different model that no longer depends on the injury-producing operating method

XIV. REBUILD-OR-REMOVE DISPOSITION RULE

Rule

The existing business model is not entitled to a safer version of the same operating method.

It must either be completely rebuilt so that the operating method no longer creates, conditions, conceals, externalizes, or monetizes the injury stream, or it must be removed.

Required Conditions for Continued Operation

Continued operation requires all of the following as enforceable conditions, not voluntary programs:

- child non-access at entry
- prevention before exposure
- independent classification and reporting
- truthful lifecycle and earnings disclosure
- labor, role, transaction, and identity clarity
- demand-side conditioning interruption
- enforceable suppression, exit, and self-exclusion
- full harm underwriting
- independent oversight and receiving mechanisms
- disqualification of original profit actors from control of prevention, research, or intervention

Removal Trigger

If the model cannot satisfy these duties without losing the revenue produced by vulnerability conversion, behavioral conditioning, ambiguity, persistence, or injury externalization, the model must be prohibited, withdrawn, dissolved, or replaced.

Ownership transfer, rebranding, trust-and-safety expansion, moderation, age-gate compliance, disclosure, cooling-off, self-exclusion, wellness tools, research funding, and intervention programs do not cure or authorize the operating method.

Corporate-Form Rule

Corporate scale cannot transform conduct that would trigger severe criminal, civil, or regulatory consequences if carried out by one person into a presumptively legitimate market merely because the conduct is distributed across platforms, owners, vendors, researchers, banks, and intervention actors.

Distribution of functions does not erase cumulative control, benefit, knowledge, or injury.

Effect

Ends the assumption that preserving the market is the default remedy.

Converts every corrective measure into a survival test for the model itself.

Prevents the same actors from retaining control through rebranding, compliance layers, or intervention capture.

Rationale

The operating method is the harm when profitability depends on child reachability, vulnerability conversion, conditioned demand, durable identity exposure, transaction ambiguity, worker risk absorption, and downstream cost transfer.

A model that cannot survive without those conditions does not need another safety layer. It needs removal.

Disposition Seal

The present model receives no presumption of survival. Safeguards that merely make the injury easier to manage are not reconstruction. Reconstruction exists only when the injury-producing operating method is no longer the source of revenue, growth, or institutional legitimacy.

Final Hard Lock

Rebuild the entire model or remove it.

If full prevention, full disclosure, full worker protection, full underwriting, independent oversight, and actor disqualification destroy the business case, that does not prove the safeguards are excessive. It proves the prior business case depended on injury that others were forced to carry.

The market does not receive a right to continuity merely because the harm was distributed through corporate structure.
