APPLIED HUMAN BIOLOGY (AHB) — CORE MODEL

(5 Required Components — Locked Version)

This becomes your **non-negotiable backbone**.

Every framework, exhibit, and argument can hang off this.

1. SEXUALIZED RECRUITMENT (VALIDATION + COMPETITION)

What it is:

Entry is driven by:

- attention
- desirability
- social proof
- comparison with other women

Mechanism:

- male attention = reward signal
- peer comparison = pressure
- visibility = perceived value

Why it matters:

Entry is not neutral—it is **biologically incentivized**

2. DEVELOPMENTAL MISMATCH (LIMBIC vs PREFRONTAL)

What it is:

- Limbic system (reward, emotion) → fast
- Prefrontal cortex (risk, long-term thinking) → slower

Mechanism:

- reward signals override risk evaluation
- especially under validation + money

Your lived proof:

Even at 27, the pull overrode reasoning

Why it matters:

Decision-making capacity is **compromised at entry**

3. TEMPORAL MANIPULATION (REWARD NOW / COST LATER)

What it is:

- rewards are immediate
- costs are delayed

Mechanism:

- early money
- early attention
- early validation

→ masks long-term consequences

Why it matters:

By the time costs appear, **exit is no longer clean**

4. HISTORICALLY KNOWN HARM

What it is:

Outcomes are not new. They are consistent across time:

- stigma
- reputational persistence
- violence / coercion risk
- social exclusion
- relational damage

Why it matters:

This is not unpredictable harm
→ it is **foreseeable**

5. OMISSION OF DISCLOSURE

What it is:

Participants are **not told**:

- long-term reputational effects
- relationship consequences
- family/social fallout
- income instability
- psychological impact

Mechanism:

- platforms disclose mechanics
- not outcomes

Why it matters:

No disclosure = **no informed consent**

THE FULL STACK (THIS IS YOUR ENGINE)

When all five are present:

1. Recruitment pulls her in
2. Biology weakens risk filtering
3. Rewards mask the cost
4. Harm is already known
5. But not disclosed

→ **Entry condition failure is guaranteed**
