

XIV. Filled-In Liability Template

Known-Risk Pathway Authorization Without Safety Reconciliation

BY STACEY KAHNS-GRAY
05/25/2026

General Child-Pathway Version

A. General Pathway Definition

The pathway at issue is a **school-authorized attention / visibility / engagement / branding pathway** in which students are taught, encouraged, credited, normalized, or institutionally directed into producing:

- online presence
- branding
- visibility
- audience engagement
- reputation
- identity display
- market-facing self-presentation
- social-media marketing
- creator-style participation
- entrepreneurship visibility
- student voice as public-facing, institution-facing, or stakeholder-facing identity
- career-readiness participation in attention systems

The pathway is not limited to platform use.

The pathway forms when school authority converts student identity, image, reputation, visibility, peer status, audience engagement, or public-facing self-presentation into instructional, social, reputational, institutional, or market-facing value.

The core inversion is this:

Children were historically recognized as vulnerable when advertising, media, platform, and attention systems captured their attention.

The school-authorized pathway now moves children into the producer role inside that same attention economy.

The child moves from:

child as audience / user / consumer / advertising target

to:

child as display surface, attention object, brand carrier, engagement generator, reputation asset, visibility producer, and market-facing identity.

The child did not become less vulnerable when the child moved from audience to visibility producer.

The institution changed the child's role inside the attention economy, but did not necessarily translate child-vulnerability protection across that role change.

This is the general child-safety pathway that must be established first.

Any unequal or sex-differentiated branch can attach later, but it is not necessary to establish the base theory.

A1. Scope Limitation

This theory does not challenge ordinary digital instruction, ordinary technology use, general media literacy, civic participation, ordinary student speech, or the use of educational technology as such.

The issue is narrower and more specific.

This theory challenges school-authorized conversion of student identity, visibility, image, reputation, audience engagement, peer status, online presence, branding, public-facing self-presentation, or market-facing identity into pathway value after the district had child-harm notice and without pathway-specific safety reconciliation.

The problem is not that students use technology.

The problem is that school authority may place students into the same attention / visibility / engagement / branding pathway that institutions already recognized as capable of harming

children, while omitting the safety reconciliation necessary to justify that exposure under school authority.

The pathway becomes legally relevant when the school does more than teach about media.

It becomes legally relevant when the school authorizes, credits, grades, promotes, normalizes, funds, requires, or stakeholder-shapes student participation in producing visibility, branding, engagement, reputation, public-facing identity, online presence, or market-facing self-presentation.

Student voice is not challenged as ordinary participation, civic engagement, or student representation.

Student voice becomes part of the pathway only when it is converted into public-facing identity, institutional messaging, stakeholder-facing participation, reputational display, audience-facing visibility, or school-approved attention production.

The issue is not relationship to a different pathway.

The issue is selective institutional handling of the same pathway function:

named as child harm when schools sought recovery from platforms;
renamed as opportunity when schools placed children into visibility production;
unnamed when foreseeable consequences returned to the child.

Lock line:

The child did not become less vulnerable when the child moved from audience to visibility producer. Protection had to travel with the role change.

A2. Responsible Actor

The responsible actor in this theory is not Meta, Google, YouTube, Instagram, TikTok, Snapchat, or any outside platform defendant.

Those entities may supply notice evidence, pathway context, or external comparison.

The liability target here is the school-side authority structure:

- school district
- school board

- district administrators
- school administrators
- public educational entity
- curriculum decision-makers
- CTE decision-makers
- vendor-approval authorities
- stakeholder-access authorities
- officials exercising compulsory supervisory authority over minors

Platform litigation matters because it shows that the child-harm pathway was already named, adopted, alleged, or recognized by school systems.

The platform defendants are not the blame target in this template.

The platform-harm theory is used as notice evidence.

The school-centered liability question arises when the district later authorizes, teaches, normalizes, funds, credits, promotes, or stakeholder-shapes the same attention / visibility / engagement / branding pathway function inside school authority without safety reconciliation.

The district cannot use platform fault to erase school-side authorization after notice.

Platform responsibility does not erase district responsibility once the district places the same pathway function inside compulsory education.

A3. Notice-to-Authorization Timeline

The governing sequence is:

- child-harm notice
 - district awareness, adoption, reliance, or recognition
 - school authorization of the same attention / visibility / engagement / branding pathway function under school authority
 - stakeholder conversion or opportunity framing
 - safety reconciliation absent
 - student exposure under school authority
 - foreseeable harm or foreseeable risk materializes
 - district refuses to own the pathway
 - harm individualized as student choice, drama, digital footprint, reputation, bad judgment, peer conflict, bullying, discipline, or online behavior

The timeline matters because the issue is not isolated student conduct.

The issue is school-authorized exposure after notice.

The district had child-harm notice first.

The district then placed children into the same pathway function under school authority.

The district did not reconcile the contradiction before exposure.

When harm returned, the district individualized the consequence instead of owning the pathway.

That is the liability sequence.

Lock line

The pathway was named as harm when it supported institutional recovery, converted into opportunity when placed under school authority, and abandoned as individual fault when the child carried the consequence.

A4. Selective Naming, Compulsory Authority, and Child Incapacity to Force Category Formation

Governing Lock

Children = children. Rules = rules. Statutes = statutes. School authority = school authority.

This pathway was not newly created by platforms or schools. It was historically known, historically unequal, and historically left unowned when women and girls carried the harm.

Schools then named the same child-facing attention / visibility / engagement / branding pathway as child harm when seeking recovery from platforms.

That naming created notice.

Naming the pathway outward creates notice. Authorizing the same pathway function inward creates responsibility. Unnaming the pathway when harm returns exposes the route-around.

Because the pathway is authorized inside compulsory educational authority, the child is not situated as a free-market participant, ordinary platform user, or independent actor. The school supplies authority, legitimacy, pressure, access, supervision, and implied safety.

The district then refused to preserve the pathway as a named child-harm pathway when authorizing the same pathway function under school authority.

The pathway was repackaged as opportunity, career readiness, student voice, branding, marketing, entrepreneurship, online presence, digital literacy, innovation, future-ready skills, or school-approved visibility production.

Stakeholders helped sanitize, normalize, deliver, benefit from, or expand the pathway.

Once the pathway becomes useful to schools, vendors, CTE programs, advisory boards, business partners, communications offices, public-relations structures, or market-facing stakeholders, the institution cannot repackage the pathway as opportunity and then deny pathway ownership when the child carries the cost.

Parental caution, student hesitation, reputational fear, discomfort, stigma awareness, and protective instinct were not obstacles to opportunity. They were safety signals. Delegitimizing them helped clear the pathway for authorization.

No pathway-specific safeguards were built because building safeguards would have required preserving the pathway identity across stages.

The child was moved from audience / user / advertising target into visibility producer / brand carrier / engagement generator / reputation asset / public-facing identity / market-facing self-presentation.

The pathway does not become different because the institution changes the child's role from audience / user / advertising target into visibility producer / brand carrier / engagement generator / reputation asset / market-facing identity.

The district cannot treat children as vulnerable when the pathway creates a claim against platforms, then treat the same children as autonomous when the same pathway function is authorized under school authority and harm returns.

When harm returned, the pathway was unnamed or refused, and the consequence was individualized as student choice, drama, reputation, digital footprint, bad judgment, online behavior, peer conflict, bullying, discipline, or personal responsibility.

The sequence does not end with opportunity. It ends when the institution refuses the pathway after harm returns and leaves the child carrying the consequence.

Any later absence of records, categories, aggregation, warnings, safety model, research category, or pathway ownership cannot be treated as naturally occurring absence where the institution renamed the pathway at authorization and unnamed it at harm.

The institution cannot name the pathway for recovery, rename it for authorization and stakeholder value, and unname it for abandonment when the child carries the harm.

Tightest Lock

Liability naming outward does not permit liability unnamings inward.

Harder Version

A school cannot name a historically known child-harm pathway to recover from platforms, repackage the same pathway function as school-approved opportunity, and then refuse the pathway when foreseeable harm returns to the child.

A5. Child Incapacity to Force Category Formation

A child cannot force the institutional category that would make her harm legible.

She cannot make an adult safe to report to after that adult has already classified her as lying, dramatic, attention-seeking, unreliable, or responsible for the consequence.

She cannot force adults to classify appearance-based targeting, motive assignment, sexualized attention, peer reinforcement, or reputational harm as serious.

She cannot force the institution to see that she is being targeted through a protected-class pathway rather than ordinary drama, peer conflict, flirting, reputation, bullying, or bad judgment.

She cannot make the institution create the right record.

If the adult routes the harm into the wrong category, the record forms wrong or not at all.

She cannot link her experience to other girls' experiences when the school keeps each event isolated.

No aggregation means no visible pattern.

She cannot force academia, OCR, schools, boards, courts, policymakers, or curriculum systems to stabilize a category around:

appearance → attention → motive assignment → classification → reputation → consequence

Without that category, the harm keeps being studied sideways, after the fact, or under weaker institutional labels.

She cannot force the institution to “know” what it prevented itself from recording.

That is the trap:

no classification → no records → no pattern → no knowledge → no duty

She cannot force a school to build the safety model that should have existed before exposure.

She cannot make the institution pause, restructure, narrow, condition, or correct the pathway.

She cannot force the district to say:

“This harm returned through a pathway we authorized.”

That is the abandonment point.

For that reason, the absence of a stable record, research category, warning structure, aggregation trail, safety model, or institutional pathway name cannot be used against the child.

The absence is part of the institutional failure.

Clean Formulation

A child cannot report, classify, aggregate, research, regulate, or abate her own way out of an institutionally unnamed pathway.

Stronger Version

The child cannot force the category, the record, the research, the safety model, or the institutional ownership. That is why the burden cannot be placed on her.

Lock Line

A child cannot force the system to name the pathway that the system is built to keep unnamed.

Revised Final Compression

The district had child-harm notice, authorized related exposure, converted children from advertising targets into advertising surfaces, omitted safety reconciliation, allowed stakeholder-shaped opportunity framing to substitute for child-safety analysis, and individualized the harm when the risk materialized.

The defect is not merely that the district failed to respond after harm.

The defect is that the district named the pathway outward for recovery, refused to preserve that name when authorizing the same pathway function inward, built no pathway-specific safeguards because doing so would require owning the pathway, and then treated the resulting absence of records, categories, aggregation, warnings, and safety model as if it were natural absence.

The child cannot cure that defect.

She cannot force the reporting channel, the classification, the record, the aggregation, the research category, the safety model, the abatement, or the district's ownership at return.

Therefore, the district cannot use the child's inability to force category formation as evidence that no pathway existed.

Final Hard Lock

The institution cannot name the pathway for recovery, rename it for authorization, and unname it for abandonment — then use the child's inability to force the missing category as proof that no institutional pathway existed.

B. Duty

The district had a duty, as a compulsory educational authority supervising minors, to exercise reasonable care before authorizing, normalizing, promoting, crediting, assigning, funding, or supervising a known-risk child-facing pathway under school authority.

That duty does not arise from a new phrase or magic label.

It arises from:

- compulsory education;
- school supervision of minors;
- curriculum control;

- board authorization;
- student-facing programming;
- stakeholder access control;
- known child-harm notice;
- school-created legitimacy;
- institutional control over warnings, records, safeguards, and alternatives.

That duty includes the advertising-role inversion.

Children historically recognized as vulnerable when advertising, media, platform, and attention systems capture their attention cannot be converted under school authority into display surfaces, brand carriers, engagement generators, visibility producers, reputation assets, or market-facing identity objects without pathway-specific safety reconciliation.

The district's duty is not limited to avoiding direct physical injury.

It includes avoiding school-authorized exposure to the same attention / visibility / engagement / branding pathway function the district had notice was capable of producing foreseeable child harm.

Once the district places that pathway function inside school authority, the district must reconcile the risk before exposure.

Safety reconciliation means the district must document how it considered the known child-harm risk before authorizing student-facing participation in visibility, branding, online presence, audience engagement, market-facing self-presentation, or public-facing identity production.

Where a board authorizes, permits, funds, approves, adopts, or allows student-facing pathway exposure after child-harm notice without documented reconciliation, the failure is not merely instructional.

It is governance-level non-reconciliation.

Lock line

A district that knows enough to name the pathway as child harm cannot place children into the same pathway function under school authority without first reconciling the risk.

C. Notice

The district had notice that attention / visibility / platform-engagement systems can harm children, disrupt education, affect student mental health, impose institutional costs, and operate through advertising-driven incentives that reward increased youth engagement.

Notice may be established through:

**direct participation in social-media litigation
joining or supporting claims against platforms
referencing or relying on platform-harm allegations
board discussion of social-media litigation
legal updates concerning youth attention systems
adoption of claims that platforms harmed children
digital-safety policies
cyberbullying policies
student mental-health records
discipline records involving online harm
parent complaints
administrator communications
curriculum documents acknowledging online risk
district materials recognizing youth vulnerability to engagement systems**

By suing, joining, referencing, relying on, or adopting claims that platforms harmed children by capturing, prolonging, manipulating, monetizing, or converting youth engagement into value, the district adopted a child-vulnerability position.

That child-vulnerability position is:

children are vulnerable when attention systems capture, prolong, manipulate, monetize, or convert their engagement into value.

That notice triggered a duty to evaluate and document whether related student-facing pathways required pathway-specific safeguards, warnings, alternatives, or safety reconciliation before authorization.

Those related pathways include:

**branding
online presence
social-media marketing
digital media
entrepreneurship
creator-style participation
student voice
career-readiness framing**

**attention production
engagement production
reputation as asset
visibility as opportunity**

The district cannot treat child attention as vulnerable when platforms capture it for advertising value, then treat school-authorized visibility production as ordinary student responsibility without pathway-specific reconciliation.

The issue is not whether classroom media instruction, marketing education, student voice, or career readiness may ever be taught.

The issue is whether the district reconciled its own child-vulnerability position before authorizing student-facing pathways that convert child identity, image, visibility, reputation, audience engagement, online presence, or market-facing self-presentation into institutional, instructional, social, reputational, or economic value.

A child becomes the advertisement when school programming requires, credits, encourages, or normalizes the child's identity, image, reputation, online profile, personal brand, audience appeal, or public-facing self-presentation as the medium through which value is produced.

That is the advertising-role inversion:

child as audience / user / consumer / advertising target

to:

child as display surface, attention object, brand carrier, engagement generator, reputation asset, visibility producer, and market-facing identity.

The child did not become less vulnerable when the child moved from audience to visibility producer.

The institution changed the child's role inside the attention economy.

The child's developmental condition did not change.

C1. Demand-Side Recognition / Supply-Side Non-Formation

The district's child-harm notice arose primarily from a demand-side framing.

In the platform-harm context, children were recognized as:

- children as users**
- children as consumers**
- children as audience members**
- children as advertising targets**
- children as attention captured by platform systems**
- children as engagement prolonged, manipulated, or monetized by outside actors**

Under that framing, schools relied on or adopted claims that children are vulnerable when attention / visibility / engagement systems capture, prolong, manipulate, monetize, or convert their participation into value.

But the school-authorized pathway changes the child's role.

The child is no longer only acted upon by the attention economy.

The child is moved into the supply-side position:

- child as visibility producer**
- child as brand carrier**
- child as engagement generator**
- child as public-facing identity**
- child as reputation asset**
- child as market-facing self-presentation**
- child as advertising surface**
- child as attention object**

This role shift required a corresponding safety translation.

The necessary question was:

What happens when children are not merely targeted by the attention economy, but trained under school authority to supply identity, visibility, branding, engagement, reputation, and market-facing self-presentation into that same economy?

No comparable supply-side safety model has been identified in the district's public authorization materials or produced record set.

The district recognized the pathway function when children were positioned as demand-side users harmed by platforms.

The district did not form the comparable pathway function when children were positioned as supply-side producers through school-authorized programming.

That is the demand-side recognition / supply-side non-formation problem.

The defect is not merely that schools failed to study social media generally.

The defect is that schools relied on child-vulnerability knowledge when the child was the platform user, then omitted comparable analysis when the school moved the child into the producer role.

This means safety reconciliation had to address both sides of the same attention economy:

Demand-side:

What happens when children are acted upon by attention systems?

Supply-side:

What happens when children are trained to produce attention, visibility, branding, engagement, reputation, and market-facing identity?

Where the district studied, adopted, alleged, or relied on the first but failed to reconcile the second, the pathway function was allowed to proceed under an incomplete knowledge model.

The child's vulnerability did not disappear.

The child's role changed.

C2. Academic Category Shift / School-Authorized Supply-Side Category Suppression

This same incomplete knowledge model is reproduced in academic category formation.

When children are positioned on the demand side of the attention economy, the category forms. Children are recognized as users, consumers, audience members, advertising targets, minors acted upon by platform design, and vulnerable subjects whose attention may be captured, prolonged, manipulated, monetized, or converted into value.

That demand-side category becomes academically legible. It can be studied through:

youth social-media harm
advertising to children
persuasive design
screen time
cyberbullying
digital citizenship
adolescent mental health
platform manipulation
consumer protection
algorithmic engagement

Child supply-side participation also becomes partially legible in one narrower lane: when the child is already visible as a monetized influencer, performer, family-content participant, or digital labor subject.

But that is not the category at issue here.

The category at issue is the school-authorized supply-side pathway: the student trained, credited, encouraged, normalized, or institutionally directed into producing visibility, branding, online presence, reputation, engagement, audience value, and market-facing identity under school authority.

When school authority moves children into that supply-side position through educational programming, the corresponding child-safety category does not comparably stabilize.

Instead of stabilizing as a school-authorized child-safety category, the school-authorized supply-side pathway is renamed through benign institutional categories:

digital literacy
career readiness
entrepreneurship
media arts
marketing education
student voice
leadership
portfolio development
communications skills
workforce preparation
personal branding

This is not a neutral research gap.

It is school-authorized supply-side category suppression at the pathway level.

The demand-side child-harm category is permitted to form when platforms act on children.

Child-influencer labor becomes partially recognizable when monetization is explicit.

But the school-authorized child-exposure category does not comparably stabilize when schools train children to supply visibility, branding, reputation, identity, audience value, and engagement into the same attention economy.

The result is produced absence at the school-authorized pathway level.

No stable academic category forms around the student trained under school authority to produce visibility, branding, online presence, reputation, engagement, and market-facing identity.

No pathway-specific safety model is demanded.

No stakeholder-benefit analysis forms.

No role-conversion analysis forms.

No school-side authorization problem becomes visible.

No record structure forms when harm returns.

The missing category is not child social-media harm generally.

The missing category is not child-influencer labor generally.

The missing category is school-authorized child supply-side exposure into the attention economy.

The child's vulnerability did not disappear.

The child's institutional and academic category was changed.

C3. Record Condition / Rebuttal Standard

This section does not require an assumption that no safety reconciliation exists.

It establishes the record condition that must be tested.

The relevant question is whether the district can identify records showing that, before authorizing student-facing attention / visibility / branding / engagement-production pathways, it reconciled its child-vulnerability position with the child's role shift from audience / user / advertising target into visibility producer / brand carrier / engagement generator / market-facing identity.

A district could rebut this section by producing records showing pathway-specific analysis of:

- child attention vulnerability
- advertising-role inversion
- student identity as value-producing surface
- developmental capacity
- peer pressure
- reward sensitivity
- public-facing identity risk
- digital permanence
- reputational risk
- stakeholder benefit
- parent / guardian warning
- student-facing decision-usable warning
- non-penalizing alternative participation structures
- record formation if harm returns
- district ownership of the pathway if consequences materialize

Generic digital citizenship, cyberbullying policy, online-safety instruction, career-readiness framing, media-literacy language, or ordinary technology-use rules do not rebut this section unless they specifically address the school-authorized role conversion at issue.

The required record is not a general statement that students should behave responsibly online.

The required record is a documented reconciliation between:

the district's adopted child-vulnerability position

and

the district's authorization of student-facing production of attention, visibility, branding, engagement, reputation, online presence, or market-facing identity.

If no such record is identified, produced, or maintained, the absence supports the conclusion that the district authorized the supply-side pathway under an incomplete knowledge model.

Lock line

Demand-side child harm became studyable. Child-influencer labor became partially recognizable once monetization was explicit. But school-authorized child supply-side exposure was renamed as education, opportunity, personal branding, marketing, digital literacy, and career readiness.

A district cannot rely on demand-side child-vulnerability knowledge for platform-harm claims while treating school-authorized supply-side category non-formation as permission to place the child into the producer role without safety reconciliation.

D. School-Authority Conversion

The pathway becomes legally relevant to the district when it is placed inside school authority.

Once the district places attention / visibility / branding / online-presence / engagement-production pathways inside:

- curriculum
- CTE
- assignments
- grading
- credit-bearing programming
- board-approved materials
- vendor programming
- stakeholder partnerships
- classroom instruction
- student-facing opportunity structures
- internships
- guest-speaker programming
- industry visits
- entrepreneurship programs
- marketing pathways
- digital media pathways
- student voice initiatives

the pathway is no longer merely external platform conduct, ordinary student conduct, stakeholder speech, or private social behavior.

It becomes school-authorized exposure.

A student encountering the pathway through school is not situated the same way as a child independently using a platform outside school.

The school supplies:

- legitimacy
- authority

supervision
access
pressure
curriculum framing
career framing
institutional approval
stakeholder validation
implied safety
reduced protective caution

School placement does not mean the district created the entire attention economy.

It means the district converted a related attention / visibility / branding / engagement-production function into a school-authorized pathway.

Once the pathway is placed inside school authority, the exposure carries institutional force because the student encounters it through curriculum, credit, grading, career-readiness framing, stakeholder access, or school-approved opportunity.

That distinction matters.

A child independently using a platform is encountering an external system.

A child directed, credited, encouraged, graded, or normalized into visibility production through school programming is encountering the pathway through compulsory educational authority.

Therefore, school placement changes the institutional responsibility analysis:

The exposure is no longer merely external platform conduct or private student activity;

it becomes exposure authorized, framed, supervised, or legitimized through school authority.

Tight lock line

The district does not need to create the attention economy to own its decision to place children into attention-production pathways under school authority.

E. Authorization

Despite child-harm notice, or after child-harm notice was available to the district, the district authorized, maintained, continued, renewed, funded, promoted, expanded, or failed to reconcile related attention / visibility / advertising-adjacent pathway functions inside school authority through:

curriculum

CTE

stakeholder involvement

vendor programming

branding instruction

online-presence development

digital marketing

entrepreneurship

student voice

creator-style participation, where supported by course, assignment, student-media, content-creation, or public-facing identity records

social-media marketing

business / marketing pathways

digital media instruction

career-readiness framing

industry-aligned instruction

school-sponsored public-facing identity development

Once the district placed those pathway functions inside school authority, the pathway was no longer merely external social conduct, platform conduct, stakeholder speech, or private student behavior.

It became school-authorized exposure.

More specifically, it became school-authorized training, encouragement, crediting, normalization, or institutional direction in moving the child from audience / user / consumer / advertising target toward visibility producer / brand carrier / engagement generator / reputation asset / market-facing identity.

The role changed from:

child as audience

to:

child as display surface, attention object, brand carrier, engagement generator, reputation asset, visibility producer, and market-facing identity.

A child becomes an advertising surface when school programming uses or develops the child's identity, image, online profile, public-facing self-presentation, personal brand, audience appeal, reputation, or visibility as the medium through which institutional, instructional, social, career, stakeholder, or market-facing value is produced.

Authorization includes district acts that:

- adopt
- approve
- fund
- teach
- assign
- credit
- supervise
- place inside curriculum
- place inside CTE
- place inside school authority

Authorization may also be shown by district acts that:

- promote
- legitimize
- incorporate
- invite stakeholders to shape
- rely on vendors to deliver
- frame as opportunity
- frame as career readiness
- frame as entrepreneurship
- frame as digital literacy
- frame as student voice

These framing acts do not need to prove the entire claim by themselves.

Their function is to show that the district converted the pathway function into school-approved opportunity after child-harm notice.

Authorization is the bridge between outside pathway influence and institutional ownership.

The district does not need to create the entire attention economy to own its decision to authorize, maintain, credit, supervise, or normalize student participation in attention / visibility / branding / engagement-production pathways inside school authority.

Tight lock line

Authorization is not platform creation. Authorization is the school-side act that converts a known-risk pathway function into school-approved exposure.

F. Stakeholder Conversion

**Stakeholders are not a side issue.
They are part of the conversion mechanism.**

Stakeholders may include:

**vendors
advisory boards
curriculum partners
business partners
CTE partners
platform-adjacent partners
advocacy groups
industry speakers
outside consultants
board influencers
curriculum influencers
career-readiness partners
digital media partners
marketing partners
entrepreneurship partners**

Stakeholders become legally relevant when records show they help convert a known-risk child-facing pathway into school-approved opportunity.

They may do this by shaping, delivering, sanitizing, legitimizing, benefiting from, expanding, or reframing attention / visibility / branding / engagement production as:

**digital literacy
student voice
career readiness
entrepreneurship
innovation
future-ready skills
marketing**

branding
online presence
creator economy
business development
platform fluency
public-facing identity development

The district remains responsible when it adopts, funds, credits, supervises, promotes, incorporates, or places that stakeholder-shaped pathway inside student-facing programming.

Stakeholder participation does not keep the pathway external once the school authorizes it.

Stakeholder support does not erase district responsibility for school-side authorization. Vendor delivery does not convert school-authorized exposure back into outside conduct.

A stakeholder is not neutral when it shapes, sanitizes, legitimizes, benefits from, expands access to, or supplies opportunity framing for the pathway.

The school supplies the authority.

The stakeholder may supply the framing, materials, access, legitimacy, labor-market justification, audience connection, business rationale, or opportunity narrative.

The stakeholder helps convert the known-risk pathway into school-approved opportunity.

The district cannot delegate safety reconciliation to vendors, stakeholders, curriculum partners, advisory boards, outside consultants, business partners, industry speakers, career-readiness partners, or platform-adjacent actors.

Once the district authorizes, credits, funds, supervises, promotes, incorporates, or places the stakeholder-shaped pathway inside school authority, the district owns its school-side authorization of that exposure.

The district does not need to create the outside market, platform system, stakeholder interest, or attention economy to own its decision to place children into the stakeholder-shaped pathway under school authority.

F1. Beneficiary / Burden Allocation

The district must identify who benefits when student identity, visibility, image, reputation, online presence, branding, public-facing participation, or engagement is converted into pathway value.

The student is not necessarily the beneficiary of the brand asset.

Value may accrue to:

**the district
the school
CTE programs
vendors
advisory-board members
business partners
industry speakers
internship hosts
platform-adjacent systems
communications offices
public-relations structures
local businesses
future employers
institutional reputation
program reputation
stakeholder access
career-pathway promotion
school marketing
community-relations messaging**

The student may receive only temporary or conditional benefit, such as:

**a grade
credential
portfolio artifact
résumé item
pathway access
teacher approval
short-term recognition
public praise
internship access
recommendation access
career-readiness credit
school-sponsored visibility**

By contrast, the student may retain the durable risk:

**reputational exposure
digital permanence
social classification**

image-based judgment
peer ranking
market-facing identity attachment
future interpretive consequences
loss of neutral student position
public-facing identity pressure
responsibility when harm returns

This creates a beneficiary / burden split.

The school-authorized pathway may produce institutional, stakeholder, vendor, programmatic, reputational, public-relations, or market-facing value while assigning long-term consequence to the child.

Safety reconciliation must therefore ask:

Who receives the value created by student visibility?

Who controls the exposure?

Who benefits from the student's image, identity, reputation, online presence, branding, or public-facing participation?

Who decides whether the exposure is necessary?

Who receives institutional, stakeholder, reputational, or economic value from the exposure?

Who bears the cost if that visibility becomes harmful?

Who owns the pathway when foreseeable consequences materialize?

Where the district authorizes a pathway in which institutional or stakeholder benefit is produced through student visibility, but the student bears the durable reputational, social, educational, digital, or interpretive consequence, the pathway cannot be treated as neutral career readiness.

The student cannot be treated as the sole responsible actor when school authority helped convert the student's identity, image, visibility, reputation, online presence, branding, or engagement into pathway value.

The district cannot centralize the benefit and individualize the burden.

The tight line:

A student cannot be converted into a brand asset under school authority without asking whose brand is being built, who receives the value, who controls the exposure, and who carries the consequence when the exposure becomes harmful.

G. Safety Reconciliation Defined

Safety reconciliation means a documented institutional analysis connecting the district's known child-harm notice to the student-facing pathway it authorized.

It must answer:

- Why is this pathway safe enough to place inside school authority?
- What known child risks attach to attention / visibility / engagement production?
- What safeguards exist before exposure?
- What warnings are provided before exposure?
- What parent / guardian notice is provided?
- What non-penalizing alternative exists?
- What stakeholders benefit?
- What student data, reputation, image, or identity value is produced?
- What developmental vulnerabilities are implicated?
- What peer-pressure risks are implicated?
- What reward-system risks are implicated?
- What long-term reputational risks are implicated?
- What board-level analysis occurred before authorization?
- What curriculum-adoption warnings were provided?
- What records will form if harm returns?
- Who owns the pathway if foreseeable consequences materialize?

Safety reconciliation is not generic online safety.

Safety reconciliation is not ordinary digital citizenship.

Safety reconciliation is not cyberbullying prevention.

Safety reconciliation is not a student handbook warning about digital footprints.

Safety reconciliation requires the district to reconcile its own child-harm notice with its own student-facing pathway authorization.

Parents cannot meaningfully consent, object, evaluate, or protect when the district does not disclose that school programming is placing students into an attention / visibility / advertising-adjacent pathway previously recognized as capable of harming children.

Student warnings are not decision-usable if they merely say “be responsible online” without identifying the school-authorized pathway, the advertising-role inversion, the visibility pressure, the stakeholder benefit, the reputational risk, and the available non-penalizing alternative.

H. Breach

The district breached its duty by failing to reconcile its child-harm notice with its student-facing authorization.

It failed to document pathway-specific safety analysis addressing:

- developmental safeguards
- youth attention capture
- advertising-role inversion
- engagement incentives
- reward sensitivity
- peer influence
- social comparison
- reputational-risk warnings
- stakeholder-benefit review
- parent / guardian warnings
- board-level warnings
- curriculum-adoption warnings
- non-penalizing opt-out or alternative assignment structures
- digital permanence
- decision-usable student warnings
- student identity as public-facing asset
- reputation as economic or social asset
- visibility pressure
- audience dependency
- engagement pressure
- self-branding pressure
- loss of neutral student position

The breach is not merely the absence of generic digital citizenship.

The breach is the absence of documented reconciliation between the district’s own child-harm notice and its authorization of student-facing attention production.

A proper safety reconciliation would have asked:

If children are vulnerable when advertising is directed at them, what changes when school programming trains them to advertise themselves?

What developmental safeguards exist before students are directed into visibility, branding, engagement, or online-presence production?

What parent / guardian warnings were provided?

What stakeholder benefit exists from student visibility?

What decision-usable warnings were provided to students before exposure?

What board-level review occurred?

What alternative exists for students who decline participation?

What records will be created if harm returns?

Who owns the pathway once the school has authorized it?

The district breached its duty by authorizing the pathway first and leaving safety reconciliation absent.

I. Causation

The district does not need to create the entire attention economy to materially contribute to legally relevant exposure.

The district's authorization materially increased, legitimized, or normalized student exposure to the known-risk pathway.

By placing the pathway inside school authority without safety reconciliation, the district:

weakened protective caution

increased participation pressure

legitimized market-facing student visibility

converted student identity, reputation, image, peer status, and engagement into pathway value

allowed stakeholder-shaped opportunity framing to substitute for safety analysis

contributed to foreseeable social, developmental, reputational, educational, and digital harm

converted student attention and identity into school-approved production value

reduced the appearance of risk by placing the pathway inside trusted educational authority

Causation does not require the district to be the sole cause.

The district materially contributes when it:

authorizes

legitimizes

supervises

- credits
- promotes
- assigns
- funds
- normalizes
- incorporates
- relies on stakeholders to shape
- fails to warn
- fails to reconcile
- fails to create alternatives
- fails to own the pathway when harm returns

The school-side defect is not a defective app feature.

The school-side defect is defective pathway authorization:

- no developmental filter
- no parent-facing warning
- no opt-in structure
- no non-penalizing off-ramp
- no stakeholder-benefit disclosure
- no advertising-role inversion analysis
- no safety reconciliation
- no pathway ownership when harm returns

The district materially contributed to foreseeable harm by authorizing a known-risk attention pathway inside school authority, converting student identity and visibility into market-facing value, omitting safety reconciliation, and later refusing to own the pathway when harm returned.

J. Harm

Students suffered or were foreseeably exposed to:

- attention capture
- mental-health burden
- reputational exposure
- peer ranking
- educational disruption
- social classification
- market-facing visibility pressure
- digital permanence

self-branding pressure
audience dependency
engagement pressure
reputation as economic or social asset
loss of neutral student position
identity pressure
online vulnerability
comparison pressure
performance pressure
public-facing reputation pressure
diminished ability to decline visibility without social or academic consequence
confusion between education, identity, marketing, and self-display

The general pathway creates child-safety notice.

The harm is not limited to a platform injury.

The harm arises when school authority legitimizes participation in a pathway already recognized as capable of harming children.

The child is not merely using digital tools.

The child is being trained, encouraged, credited, or normalized into becoming a visibility-producing object inside an attention system.

That is the advertising-role inversion.

K. Responsibility Transfer

When harm returned, the district refused to own the pathway it authorized and instead individualized the consequence as:

student choice
drama
digital footprint
peer conflict
reputation
bad judgment
online behavior
bullying
discipline issue

interpersonal conflict
ordinary social conflict
personal responsibility
misuse of technology
failure to behave responsibly online

The district cannot treat children as vulnerable when attention systems harm them externally, then treat students as fully autonomous when the district authorizes related attention-production pathways internally.

The district cannot treat children as vulnerable when advertising is directed at them, then treat students as fully autonomous when school programming trains them to become advertising.

Responsibility transfer occurs when the district adopts child-vulnerability logic for recovery against platforms, but applies adult-choice logic when harm returns through school-authorized exposure.

The district cannot use one theory for external recovery and the opposite theory for internal responsibility.

If children are vulnerable when platform systems capture their attention, they remain vulnerable when school systems train them to produce attention.

The vulnerability did not disappear.

The role changed.

L. Anticipated Substitutions That Do Not Cure the Breach

The district may attempt to substitute generalized programs or labels for pathway-specific safety reconciliation.

Those substitutions do not cure the breach.

Generic digital citizenship does not equal pathway-specific safety reconciliation.

Cyberbullying policy does not equal authorization analysis.

Online-safety instruction does not equal advertising-role inversion analysis.

Digital-footprint warnings do not equal developmental-capacity analysis.

Career-readiness language does not erase child-harm notice.

Entrepreneurship framing does not erase school-side exposure.

Student voice language does not erase visibility-risk analysis.

Stakeholder support does not erase district ownership.

Vendor delivery does not erase district responsibility.

Platform responsibility does not erase school-side negligent exposure after notice.

Student choice does not erase school authorization.

A non-required activity does not cure the problem unless the alternative is genuinely non-penalizing, equally available, non-stigmatizing, and not status-reducing.

An alternative is not meaningful if refusal reduces grade access, credit access, pathway access, status, opportunity, participation, teacher approval, peer standing, career-pathway access, student recognition, recommendation access, or school-sponsored visibility.

The district cannot avoid responsibility by saying:

students chose to participate
stakeholders only advised
the program was about skills
digital citizenship was taught
platforms caused the harm
online behavior is outside school control
social consequences are merely peer conduct
the pathway was career readiness
participation was optional
no specific injury was intended
no one forced the student to post
the risk is obvious
students already use social media

Those defenses fail because the issue is not external platform use.

The issue is school-authorized exposure after notice without safety reconciliation.

L1. Non-Delegation Rule

The district cannot delegate safety reconciliation to vendors, stakeholders, curriculum partners, advisory boards, business partners, guest speakers, industry representatives, or outside consultants.

Vendor delivery does not convert school-authorized exposure back into external conduct.

Stakeholder support does not make the pathway neutral.

Curriculum partnership does not erase district ownership.

Advisory-board involvement does not remove board responsibility.

Once the district adopts, approves, funds, teaches, promotes, credits, assigns, or places the pathway inside school authority, the district owns the exposure.

The district may use outside materials.

It may not outsource the duty to reconcile known child-harm notice with student-facing pathway authorization.

M. Corrective / Abatement Logic

Corrective relief should follow the same logic schools used against platforms:

The pathway must be corrected, not merely the individual incident.

Required corrective measures include:

- pathway-specific safety reconciliation
- parent / guardian warnings
- student-facing decision-usable warnings
- stakeholder-benefit disclosure review
- curriculum review
- board-level review
- developmental-capacity analysis
- reputational-risk analysis
- advertising-role inversion analysis
- non-penalizing alternatives for students

opt-in / opt-out clarity
record formation when harm returns
ownership of the authorized pathway rather than individualization of consequence
review of vendor and stakeholder influence
review of CTE and marketing pathway materials
review of online-presence assignments
review of branding instruction
review of entrepreneurship instruction involving visibility production
review of student voice structures that create public-facing identity pressure

Generic digital citizenship, cyberbullying language, or online-safety instruction does not satisfy this requirement unless it specifically reconciles the school-authorized attention / visibility / advertising pathway.

The corrective question is not merely:

Did the school teach students to be safe online?

The corrective question is:

Did the school reconcile its own child-harm notice with its own authorization of student-facing attention production?

Abatement requires more than review after harm.

No further expansion, grading, promotion, stakeholder delivery, public-facing student participation, or school-authorized exposure in attention / visibility / branding / online-presence / engagement-production pathways should continue until the district completes pathway-specific safety reconciliation.

Corrective action must pause, condition, restructure, or narrow the pathway until the district can document:

what the pathway is
what child-harm notice existed
who authorized the pathway
which stakeholders shaped or benefited from it
what risks attach to the pathway
what warnings are provided
what parent / guardian notice is provided
what alternatives exist
what records will form if harm returns
who owns the pathway if foreseeable consequences materialize

Abatement means the pathway is corrected at the structural level.

It does not mean the district waits for individual harm, handles the incident, and leaves the pathway intact.

N. Reserved Later Attachment: Unequal or Sex-Differentiated Impact Branch

This section is preserved but not used to establish the general child-pathway theory first.

After the general child-harm pathway is established, an unequal-impact or sex-differentiated branch may be evaluated as a later attachment point.

That later branch may address whether the pathway foreseeably lands differently through:

- sex-differentiated impact
- appearance ranking
- sexualized interpretation
- desirability scoring
- body comparison
- sexual rumor
- image-based harm
- reputational classification
- lasting stigma
- digital permanence
- individualized blame

For female students, the reserved later branch may show that the pathway foreseeably produces sex-differentiated harm through:

- appearance ranking
- desirability scoring
- sexualized interpretation
- body comparison
- sexual rumor
- image-based harm
- reputational classification
- lasting stigma
- digital permanence
- individualized blame

The general pathway creates child-safety notice.

The later branch shows the sex-differentiated consequence the district failed to evaluate, warn against, record, or own.

For now, this material is reserved.

It does not need to carry the initial theory.

The initial theory stands on general child-harm notice, school authorization, advertising-role inversion, safety reconciliation absence, and responsibility transfer.

N1. Broader Governance Significance — Reproduction of Female Harm Without Reviving Time-Barred Claims

This theory does not seek to revive time-barred individual claims. It identifies a current governmental pathway problem: public schools continue to authorize attention / visibility / branding / online-presence exposure after child-harm notice without documented safety reconciliation.

The broader significance is that unreconciled school-authorized visibility pathways can reproduce longstanding inequality toward female students. Once student visibility, image, reputation, peer status, and market-facing identity become pathway value, female students foreseeably face distinct risks: sexualized interpretation, appearance ranking, desirability scoring, rumor, image-based harm, reputational permanence, digital footprint blame, and individualized responsibility when harm returns.

The pathway is authorized as opportunity at the front end and individualized as female choice, drama, reputation, or bad judgment at the back end. That is how longstanding female harm can be renewed through public systems without being named as institutional responsibility.

The requested action remains prospective: identify the pathway, reconcile known risks, review sex-differentiated impact, disclose stakeholder benefit, provide decision-usable warnings, create non-penalizing alternatives, and form records when harm returns.

O. Liability Conclusion

The district's liability arises from known-risk pathway authorization without safety reconciliation.

The district had notice that attention / visibility / platform-engagement systems harm children.

It authorized related school-based exposure.

It converted children from advertising targets into advertising surfaces.

It failed to conduct safety reconciliation.

It failed to provide pathway-specific safeguards, warnings, alternatives, and ownership structures.

It allowed stakeholder-shaped opportunity framing to substitute for child-safety analysis.

It individualized the harm when foreseeable consequences materialized.

This is known-risk pathway authorization without safety reconciliation.

P. Proof, Abatement, and Records Required

P1. Pathway Authorization Test

Use this test to determine whether the structure is triggered:

1. Did the district sue, join, reference, rely on, adopt, or recognize claims that attention / visibility / platform-engagement / advertising-driven systems harm children?
2. Did the district authorize, teach, promote, fund, credit, assign, normalize, or place inside school authority student participation in branding, online presence, social-media marketing, digital media, entrepreneurship, student voice, creator-style participation, business / marketing pathways, or attention-production systems?
3. Did stakeholders, vendors, advisory boards, curriculum partners, business partners, industry partners, advocacy groups, platform-adjacent actors, guest speakers, or board influencers shape, sanitize, legitimize, deliver, benefit from, or expand the pathway?
4. Did the district create a safety reconciliation record connecting its child-harm notice to its student-facing pathway authorization?

5. Did the district conduct developmental-capacity analysis, advertising-role inversion analysis, reputational-risk analysis, stakeholder-benefit review, parent / guardian warning analysis, or student-facing decision-usable warning analysis before exposure?
6. Did the district provide a genuinely non-penalizing alternative for students who declined participation?
7. Did the district create a record-formation system for harm returning through the authorized pathway?
8. When harm returned, did the district name and own the pathway, or did it individualize the consequence as student choice, drama, digital footprint, peer conflict, reputation, bad judgment, bullying, discipline, interpersonal conflict, or online behavior?

If the answers are:

notice exists

authorization exists

stakeholder shaping exists

safety reconciliation is absent

warnings are absent or generic

alternatives are absent or penalizing

harm is individualized

then the structure is triggered.

P2. Evidence Map

The proof structure should be organized by element.

Element	Evidence Needed
Notice	platform litigation, board updates, legal memos, public statements, digital-safety policies, cyberbullying policies, student mental-health records, discipline records, administrator communications, parent complaints

Authorization	CTE records, curriculum, assignments, rubrics, course descriptions, board approvals, business / marketing pathway materials, digital media lessons, online-presence instruction, branding materials, student voice materials
Stakeholder Conversion	vendor contracts, advisory-board rosters, partner records, industry visit records, guest speaker records, curriculum partner records, business partner records, procurement files, board packets, communications with outside actors
Safety Reconciliation Absence	no responsive records, CPRA / PRA responses, missing board analysis, missing curriculum risk review, missing developmental analysis, missing stakeholder-benefit review, missing pathway-specific safety model
Warning Failure	parent notices, student-facing disclosures, handbooks, syllabi, assignment instructions, opt-in / opt-out language, digital citizenship materials, absence of decision-usable pathway warnings
Alternative Failure	assignment structures, grading policies, participation requirements, CTE requirements, pathway completion requirements, public-facing project requirements, status or recognition tied to participation
Harm / Responsibility Transfer	discipline records, parent emails, complaint summaries, incident records, administrator communications, digital-footprint language, bullying substitution, peer-conflict framing, reputation / bad-judgment language

Abatement Need	continued pathway operation, absence of pause, absence of restructuring, absence of board-level corrective action, continued vendor delivery, continued stakeholder involvement, continued grading or promotion of exposure
----------------	---

This evidence map prevents the theory from remaining abstract.

It shows how each element can be proved through records.

P3. Records Still Needed

The following records should be requested, searched, or preserved:

safety reconciliation records
 board approval records
 board agendas
 board minutes
 board packets
 legal updates concerning platform litigation
 social-media litigation updates
 curriculum adoption records
 CTE course descriptions
 business / marketing pathway records
 digital media curriculum
 social-media marketing lessons
 online presence assignments
 branding instruction
 entrepreneurship instruction
 student voice programming
 creator-style participation materials
 rubrics
 lesson plans
 teacher guides
 student-facing warnings
 parent / guardian notices
 opt-in / opt-out forms
 alternative assignment records
 vendor contracts

vendor communications
stakeholder rosters
advisory-board records
industry visit records
guest speaker records
business partner records
curriculum partner records
procurement files
conflict disclosures
Form 700 disclosures where applicable
risk analyses
developmental-capacity analyses
reputational-risk analyses
advertising-role inversion analyses
stakeholder-benefit reviews
sex-differentiated impact analyses, if later branch is being evaluated
incident records where harm returned
discipline records involving online behavior, reputation, social-media use, bullying, peer conflict, digital footprint, or public-facing student identity
administrator emails concerning student harm, online behavior, reputation, visibility, branding, or digital conduct
no-record confirmations if safety reconciliation does not exist

If records do not exist, the no-record confirmation becomes proof of non-reconciliation.

P4. Hard Abatement Requirement

Corrective action must address the pathway itself.

The district should not continue expanding, grading, promoting, funding, stakeholder-delivering, or requiring public-facing student participation in the pathway until safety reconciliation is complete.

Abatement requires:

pause
condition
restructure
narrow
warn
provide alternatives

- document ownership
- review stakeholder benefit
- create record-formation rules
- assign institutional responsibility

Abatement is not satisfied by:

- digital citizenship
- cyberbullying language
- online-safety instruction
- student handbook warnings
- career-readiness framing
- general media literacy
- platform blame
- student choice language
- after-the-fact discipline
- incident-only response

The pathway must be corrected, not merely the individual incident.

P5. Legal Label Menu

Possible legal containers include:

- known-risk pathway authorization without safety reconciliation
- negligent exposure after notice
- institutional exposure after notice
- known-risk non-translation
- failure to safeguard
- failure to warn
- negligent supervision
- public-entity negligence
- governance-level non-reconciliation
- stakeholder-shaped pathway authorization
- protective-friction removal without safeguard replacement
- advertising-role inversion without safety reconciliation
- responsibility transfer after school authorization
- abatement of school-authorized child-risk pathway
- failure to conduct risk assessment
- failure to provide decision-usable warnings

failure to provide non-penalizing alternatives
failure to own the pathway when foreseeable harm returns

The legal label may vary by forum.

The core structure remains:

child-harm notice

- school authorization
 - stakeholder conversion
 - safety reconciliation absent
 - exposure under compulsory supervision
 - foreseeable harm
 - responsibility transfer
-

P6. Final Proof Compression

The proof question is not:

Did the platform harm children?

The proof question is:

Did the district have notice that attention / visibility / platform-engagement / advertising-driven systems can harm children, then authorize related student-facing exposure inside school authority without safety reconciliation?

The proof question is not:

Did the student misuse technology?

The proof question is:

Did the district convert student identity, visibility, reputation, image, peer status, or engagement into school-approved pathway value after child-harm notice?

The proof question is not:

Did the district teach digital citizenship?

The proof question is:

Did the district reconcile its own child-harm notice with its own student-facing pathway authorization?

The proof question is not:

Did a stakeholder merely advise?

The proof question is:

Did the stakeholder help convert a known-risk pathway into school-approved opportunity, and did the district authorize that conversion inside compulsory education?

The proof question is not:

Did the harm happen outside the classroom?

The proof question is:

Did the school-authorized pathway increase, legitimize, normalize, or structure the exposure that made the harm foreseeable?

XV. Compact Pleading Paragraph

A school district exercising compulsory supervisory authority over minors had notice that attention / visibility / platform-engagement systems can harm children, disrupt education, affect student mental health, impose institutional costs, and operate through advertising-driven incentives that reward increased youth engagement. By suing, joining, referencing, relying on, or adopting claims against social-media platforms, the district adopted a child-vulnerability position: children are vulnerable when attention systems capture, prolong, manipulate, and monetize their engagement. Despite that notice, the district authorized related student-facing pathways through curriculum, CTE, stakeholder partnerships, vendor involvement, branding instruction, digital marketing, online-presence development, entrepreneurship, student voice, creator-style participation, or career-readiness programming. That authorization created an advertising-role inversion: the child moved from being advertised to into being trained to become the advertisement. Student identity, visibility, reputation, image, peer status, and engagement became the medium through which pathway value was produced. Once the district placed the pathway inside school authority, the exposure was no longer merely external platform conduct, stakeholder speech, or private student behavior. It became school-authorized exposure under compulsory educational supervision. The district therefore had a duty to reconcile its known child-harm notice with its student-facing authorization. The district breached

that duty by failing to conduct or document pathway-specific safety reconciliation, developmental risk analysis, advertising-role inversion analysis, reputational-risk analysis, stakeholder-benefit review, parent / guardian warnings, board-level warnings, curriculum-adoption warnings, student-facing decision-usable warnings, or genuinely non-penalizing alternatives before exposure. The district's authorization materially legitimized and increased student exposure to the pathway. The district did not need to create the entire attention economy to materially contribute to foreseeable harm; it contributed by authorizing, legitimizing, supervising, crediting, promoting, funding, assigning, or normalizing the pathway after notice. When foreseeable harm returned, the district refused to name or own the pathway and instead individualized the consequence as student choice, drama, digital footprint, peer conflict, reputation, bad judgment, bullying, discipline, interpersonal conflict, or online behavior. Generic digital citizenship, cyberbullying policy, online-safety instruction, career-readiness framing, stakeholder support, or platform blame does not cure the defect because the defect is school-authorized exposure after child-harm notice without pathway-specific safety reconciliation. This is known-risk pathway authorization without safety reconciliation.

XVI. Final Compression

The district had child-harm notice, authorized related exposure, converted children from advertising targets into advertising surfaces, omitted safety reconciliation, and individualized the harm when the risk materialized.

Harder Version

The district adopted the position that children are vulnerable when attention systems capture and monetize them, then authorized school-based pathways that trained children to produce attention, visibility, branding, engagement, reputation, and market-facing identity without safety reconciliation.

Bellwether-Mirror Version

The same logic the district used against platforms applies back to the district:

If children are vulnerable when advertising-driven systems capture their attention, they are also vulnerable when school programming trains them to become the attention object.

School-Authority Version

Once the district placed attention-production, branding, online-presence, digital-marketing, entrepreneurship, creator-style participation, or visibility production inside school authority, the pathway was no longer merely external platform conduct.

It became school-authorized exposure.

Stakeholder Version

Stakeholders helped convert the known-risk pathway into school-approved opportunity, but school authorization converted that opportunity framing into district responsibility.

Defense-Block Version

Digital citizenship does not cure failure to reconcile a school-authorized attention pathway after child-harm notice.

Career readiness does not erase child vulnerability.

Student choice does not erase school authorization.

Platform fault does not erase school-side exposure after notice.

Vendor delivery does not erase district responsibility.

Stakeholder support does not erase school ownership.

Optional participation does not cure the defect if the alternative is penalizing, status-reducing, grade-reducing, opportunity-reducing, or not equally available.

Abatement Version

The pathway must be corrected, not merely the individual incident.

No further expansion, grading, promotion, stakeholder delivery, or public-facing student participation in school-authorized attention / visibility / branding / online-presence pathways should continue until the district completes pathway-specific safety reconciliation.

Shortest Lock

Children were protected when advertised to.

Then school-authorized pathways trained them to become the advertisement.

The vulnerability did not disappear.

Final Lock

The same child-harm pathway cannot be named in court, authorized in school, converted through stakeholders, left unreconciled, and individualized when harm returns.
