

I. PRE-ENTRY CORRECTION

(UPSTREAM — SCHOOLS)

CONDITION (LOCK THIS)

Observed behavior within these systems occurs under conditions lacking boundary protection and classification containment.

Accordingly, baseline behavioral conditions are not present.

1. Applied Human Biology (AHB) — Pre-Puberty

Action

Require pre-exposure biological literacy instruction covering:

- reward loops
- limbic vs prefrontal mismatch
- validation as signal vs value
- reward now / cost later dynamics

Effect

Converts instinct → decision-usable understanding

Reduces entry under misinterpreted signals

Rationale

Known developmental mismatch exists but is not translated into safeguards

2. Behavioral Model Consistency (Institutional Application)

Action

Extend existing behavioral frameworks to include:

- sexualized attention
- peer labeling
- reputational formation

Effect

Interrupts early-stage classification pathway
Aligns institutional behavior across domains

Rationale

Institutions demonstrate capacity but do not apply it consistently

II. ENTRY CONDITION CORRECTION

(PLATFORM / MARKET)

3. Mandatory Outcome Disclosure (Onboarding Standard)

Action

Require disclosure of:

- median earnings
- earnings distribution
- attrition rates
- lifecycle duration
- reputational persistence (if tracked)
- expected escalation requirements to maintain visibility and income over time

Effect

Converts unknown risk → decision-usable information
Enables probability-based evaluation

Rationale

Absence of supply-side data prevents informed consent

4. Cooling-Off / Activation Delay

Action

Introduce 24–72 hour delay prior to any public or monetized exposure

Require exposure to:

- outcome data
- risk models
- AHB concepts

Effect

Disrupts reward-loop-driven entry
Restores evaluation window

Rationale

Reward dominance occurs prior to risk evaluation

III. SYSTEM STRUCTURE CORRECTION

5. Comparative Model Alignment (Acting Model)

Action

Introduce structural elements:

- labor clarity
- role vs identity separation at point of participation
- defined compensation pathways
- contractual expectations

Effect

Moves system from aspiration-driven → structure-driven
Reduces identity collapse and classification instability

Rationale

Aspiration without structure produces distorted entry conditions

6. Intent-Based Transaction Disclosure (Law Flip)

Action

Where sexual use is intended → payment functions as required disclosure

Effect

Restores transaction recognition at entry
Reduces reliance on ambiguity as a structural requirement
Allows performance to exist as performance rather than required misrepresentation

Rationale

Transaction obfuscation weakens risk recognition at entry

IV. HARM MITIGATION (DURING + POST PARTICIPATION)

7. Hazard Classification Framework

Action

Define and communicate:

- reputational persistence risk
- classification lock-in
- asymmetrical social cost
- coercion exposure

Effect

Reframes participation as risk-managed activity

Enables non-moral intervention

Rationale

Risks are known but not structured into usable frameworks

8. Reputational Mitigation / Exit Pathways

Action

Establish enforceable mechanisms for:

- identity separation
- content suppression over time
- transition support frameworks

Effect

Reduces irreversibility

Improves exit viability

Rationale

Reputational persistence creates structural lock-in

9. Self-Exclusion / Participation Control Mechanism

Action

Implement voluntary, enforceable participation limits:

- time-bound or permanent self-exclusion options
- cross-account and payment-method enforcement
- mandatory cooldown periods prior to reactivation
- restriction from platform marketing and re-targeting during exclusion

Effect

Introduces interruption during active reinforcement conditions

Disrupts escalation and continuous re-entry behavior

Creates pre-commitment across non-reward and reward states

Rationale

Participation is sustained through reinforcement loops and temporal distortion;

no structured interruption mechanism currently exists despite known behavioral dynamics

V. KNOWLEDGE & ACCOUNTABILITY CORRECTION

10. Supply-Side Research Standardization

Action

Require:

- lifecycle outcome studies
- earnings distribution tracking
- exit condition analysis
- reputational impact measurement

Effect

Closes demand vs supply knowledge gap

Enables evidence-based policy

Rationale

Demand is optimized while outcomes remain undisclosed

SYSTEM EFFECT (COMBINED)

When implemented together:

- Entry becomes informed, not reactive
- Participation becomes structured, not ambiguous
- Risk becomes visible, not delayed
- Outcomes become acknowledged, not externalized

CORE POSITION (LOCK THIS)

These interventions do not restrict participation.

They remove distortion, non-disclosure, and asymmetry at the point of entry and throughout the system.

FINAL LINE

This is not a prohibition model.

It is a correction model that removes the conditions under which decisions are made without baseline behavioral protections.
