

Classification Blockade Doctrine: Deliberate Indifference at the First Control Node

By Stacey Kahns Gray 05/05/2026 For my sisters past and present and future

I. GOVERNING CONTROL CHAIN (LOCKED ORDER — DUTY GOVERNING)

foreseeability

- historically known sex-based harm pathway
- specificity established through comparator (not “general behavior”)

- uneven start (baseline distortion)
- girls enter under weaker first-stage classification protection
- neutrality already broken

→ duty

- attaches at possible sex-based signal (pre-outcome)
- non-delegable at intake
- requires classification sufficient to activate protected pathway
- governed by Title IX non-discrimination mandate and response obligations

→ **evaluation sequence constraint (ADDED)**

- possible sex-based signal
- **Title IX evaluation must occur prior to any exclusion or downgrade**
- classification discretion is temporally subordinate to evaluation obligation
- institution cannot determine “not sex-based” before applying sex-based framework
- **pre-evaluation downgrade = prohibited sequence**
- duty execution requires evaluation first, classification second
- breach occurs where sequence is reversed (decision before evaluation)

→ knowledge attachment (classification-independent)

- possible sex-based signal observed, reported, or reasonably knowable
- constitutes institutional knowledge under Title IX at the moment of signal
- knowledge attaches independent of classification label or category assignment
- misclassification, downgrade, or alternative labeling does not negate or reset knowledge
- duty is triggered by the signal itself, not by institutional recognition or categorization
- breach occurs when institutional handling of that signal downgrades, bypasses, or fails to activate the required protected pathway

→ classification decision (control node)

- first institutional actor receives signal

- duty is executed or breached at intake
- legal pathway determined through classification

→ **order-of-operations constraint (ADDED)**

- classification must occur **inside** Title IX evaluation, not prior to it
- first actor cannot resolve signal outside protected framework
- any classification made prior to evaluation
- functions as pathway bypass
- converts discretionary act into duty breach at intake

- no downward discretion rule
- ambiguous / qualifying signal must resolve upward into protected category
- downward resolution prohibited
- defines minimum required execution of duty

- pathway activation / suppression

IF duty executed (upward classification)

- Title IX routing engaged
- Coordinator engaged
- record formation
- aggregation enabled

IF duty breached (downward / bypass classification)

- protected pathway suppressed
- record formation fragmented or absent
- aggregation disabled

- comparator
- same institution demonstrates:
 - mandatory routing
 - unified records
 - early intervention
- establishes capacity and correct duty execution pathway

- statute
- 20 U.S.C. §1681
- 34 C.F.R. §106.30
 - defines qualifying sex-based conduct (signal threshold)
- 34 C.F.R. §106.44(a)
 - knowledge + response duty attaches upon qualifying signal
- 34 C.F.R. §106.8(a)
 - Coordinator routing required
- 34 C.F.R. §106.45

- grievance + record system activation
 - statutory duties attach through qualifying classification + routing
 - tort
 - foreseeable harm + supervisory control
 - duty exists independent of intent
 - breach occurs at classification stage when duty not executed
 - causation
 - breach of duty through classification blockade
 - continued exposure
 - non-aggregation
 - predictable downstream harm
-

II. MECHANISM OF BREACH (CLASSIFICATION BLOCKADE)

possible sex-based signal

- received by institutional actor
- classification discretion exercised

→ **sequence violation trigger (ADDED)**

IF evaluation skipped or preempted

- “not sex-based” determined before Title IX analysis
- signal never enters protected evaluation framework
- statutory pathway never activates
- **breach by sequence violation (not judgment error)**

IF downward classification (“teasing / conflict / attention”)

- protected category not engaged
- Title IX pathway not activated
- Coordinator not notified
- records fragmented or not created
- aggregation impossible
- pattern recognition prevented

Result:

- operational knowledge suppressed at system level
- institution later asserts “no actual knowledge”
- assertion is produced by its own classification blockade, not by absence of signal

III. NO DOWNWARD DISCRETION RULE (CONSTRAINT LAYER — UPGRADED)

ambiguous or qualifying sex-based signal

- must be evaluated under Title IX framework first
- only after evaluation
- may classification narrow, exclude, or reassign category

→ prohibits:

- pre-evaluation exclusion (“not sex-based”)
- category substitution prior to evaluation
- neutrality application before protected analysis

Effect:

- establishes **temporal floor (evaluation before classification)**
 - prevents sequence reversal as evasion mechanism
 - preserves statutory routing and knowledge formation
-

IV. PATHWAY DIVERGENCE (CONTROL EFFECT)

Upward classification

- Coordinator engaged
- unified record system
- aggregation across incidents
- early intervention
- exposure interrupted

Downward / bypass classification

- Coordinator bypassed
 - fragmented or absent records
 - no aggregation
 - no pattern recognition
 - continued exposure
-

V. COMPARATOR LOCK (CAPACITY PROOF)

same institution or comparable systems

- apply upward classification rules in other protected domains
- enforce:
 - mandatory routing
 - centralized records
 - trained classification protocols
 - auditing and correction

Effect:

- proves institutional capacity
- defeats incapacity defense
- demonstrates selective non-application

VI. STATUTORY ATTACHMENT

possible sex-based conduct

- triggers Title IX classification / routing obligation
- proper classification executes duty
- misclassification breaches duty; it does not prevent duty from attaching

→ 20 U.S.C. §1681

→ 34 C.F.R. §106.30

→ 34 C.F.R. §106.44(a)

→ 34 C.F.R. §106.8(a)

→ 34 C.F.R. §106.45

misclassification

- operates as statutory evasion mechanism
- prevents activation of required duties
- does not erase underlying signal
- converts existing duty into non-executed duty

VII. TORT ALIGNMENT (PARALLEL LIABILITY)

foreseeable harm pathway

- institutional control over classification
- failure to activate available protective pathway
- breach of duty at intake

- supervision and protection failure
- intent not required

comparator + structure

- show non-application, not inability
-

VIII. CAUSATION (STRUCTURAL CONTINUITY)

classification blockade

- suppresses pathway activation
- suppresses record formation
- suppresses aggregation
- suppresses operational knowledge formation
- allows continued exposure
- produces predictable downstream harm

causal chain

- intact from intake to outcome
-

IX. ESCAPE ROUTE COLLAPSE (INTEGRATED)

foreseeability dilution → blocked

threshold inflation → blocked

category substitution → blocked

discretion preservation → blocked

fragmentation → blocked

neutrality defense → defeated

autonomy shift → defeated

knowledge suppression → defeated

response substitution → defeated

intent shield → irrelevant

X. FINAL HARD LOCK (UPGRADED)

foreseeability

- duty

duty

→ controlled at classification

evaluation sequence

→ must precede classification

classification

→ constrained (no downward discretion)

constraint

→ forces pathway activation

pathway activation

→ forces record formation + operational knowledge

knowledge

→ forces statutory + tort obligations

IF sequence preserved

→ duty executed

IF sequence reversed (decision before evaluation)

→ duty structurally bypassed

→ breach fixed at intake

→ no downstream correction cures initial violation

XI. SINGLE-LINE DOCTRINAL CLAIM (CAM READY)

Known sex-based harm pathways create a pre-outcome duty that attaches at the moment of signal; where institutional actors reverse the required evaluation sequence, exercise downward classification discretion, bypass routing, or fail to activate the protected pathway, the resulting failure of record formation, aggregation, and operational knowledge is a controlled institutional outcome, not an absence of awareness, and constitutes deliberate indifference at the first control node with resulting statutory and tort liability through foreseeable causal continuity.

FINAL LOCK

They can:
evaluate and then decide no

They cannot:
decide no instead of evaluating

→ sequence violation = liability attachment at intake
